Congress Secretariat

International Conference Services, Ltd. 2101 – 1177 West Hastings St. Vancouver, BC, Canada, V6E 2K3 Tel +1 604 681 2153 Fax +1 604 681 1049 vancouver@icsevents.com www.icsevents.com

Dear Colleagues,

As Co-chairs of the 2015 World Congress on Medical Physics and Biomedical Engineering, it is our great pleasure to welcome you to Toronto.

The World Congress is co-hosted by IUPESM (International Union for Physical and Engineering Sciences in Medicine), IOMP (international Organization for Medical Physics), IFMBE (International Federation for Medical and Biological Engineering), and here in Canada by COMP (Canadian Organization of Medical Physicists) and CMBES (Canadian Medical and Biological Engineering Society). These five organizations have collaborated to ensure that this Congress features exciting scientific sessions on a wide range of topics in medical physics and biomedical engineering, presented by scientists and engineers from around the world.

The Congress Organizing Committee and its sub-committees have worked hard to develop a rich and stimulating scientific program, with time set aside for mingling with colleagues and celebrating our successes. We are also proud of the range of plenary sessions, ancillary meetings and continuing education events being offered, along with an excellent range of exhibits. We encourage you to explore and participate in the various offerings of the congress. We also thank our congress planning partners, International Congress Services Ltd., whose people have worked tirelessly to ensure that this Congress is a rewarding and pleasurable experience for all.

We encourage you to reconnect with colleagues you may not have seen for a while, and to take the opportunity to meet new colleagues and form new connections around the world. Also, do take some time to explore our city. Here in Toronto, we are proud to be one of the most multicultural cities in the world, and of our rating as the safest large metropolitan area in North America. There are many exciting cultural sites nearby and a wonderful variety of restaurants serving many different cuisines, so don't hesitate to explore our city and enjoy its warmth and diversity.

Thank you for attending the 2015 World Congress, and welcome to Toronto!

David Jaffray, PhD

Tony Easty, PhD, PEng, CCE

Welcome to the 2015 World Congress on Medical Physics and Biomedical Engineering

We have created a World Congress—Why? What possesses us to work for three years to create this triennial event? Are we crazy? What has compelled David and Tony to take a chunk of their lives and of those many, many other people who contributed on the Congress Organizing Committee and all of the other WC 2015 committees and donate it to a World Congress on Medical Physics and Biomedical Engineering? This is among the greatest non-deductible, charitable contributions of which I am aware! It must be pretty important to them and to us. Thank you David Jaffrey and thank you Tony Easty—I don't know how many times you will hear this during the coming week, but I can assure you that it will not be enough times!

Anticipation for this World Congress has been building slowly since our last gathering in Beijing, but recently that anticipation has been crescendoing. We have collected an international snapshot of advances in medical physics and biomedical engineering. This is an excellent opportunity to share best practices and theories, strengthen and create new global relationships, mentor young engineers and physicists and begin new projects at home and abroad. Thank you all present for your support and assistance in making WC 2015 a success! We could not have done it without you.

The five themes of the World Congress are:

- 1) Global Health Challenges,
- 2) Evidence and Health Informatics,
- 3) Women in Biomedical Engineering and Medical Physics,
- 4) Urban Health and Future Earth, and
- 5) Next Generation Medicine.

These are broad themes that capture some of the most important issues we face today.

We have the privilege of celebrating the lives and work of several IUPESM, IFMBE and IOMP Award winners, who will be introduced at the Opening Ceremony and will each give us a "kort verslag" or precis of their work. We will have the additional pleasure of recognizing the achievements of early-career medical and biological engineers and medical physicists who have won one of several young investigator awards here in Toronto. You, the people here, will have the opportunity to discuss the future of clinical engineering, medical physics and biomedical engineering. You have the chance to attend many special sessions within the 5 themes and 19 tracks of the World Congress. You can help shape policies for both developed and developing nations.

The delegates to the IUPESM General Assembly and the IOMP and IFMBE General Assemblies will be able to select their leaders for the immediate future; they will also select the location of the 2021 World Congress. Please delegates - vote intelligently and secure a good realization of our future.

Since I first read these words of T.S. Eliot in LITTLE GIDDING (No. 4 of 'Four Quartets') I have been strangely calmed by them; I thought I would share them with you as I wish you a successful WC 2015:

We shall not cease from exploration And the end of all our exploring Will be to arrive where we started And know the place for the first time.

Best wishes,

Herbert F. Voigt, PhD IUPESM President

INTERNATIONAL ORGANIZATION FOR MEDICAL PHYSICS

Member of the International Union of Physical and Engineering Sciences in Medicine (Union Member of the International Council for Science)

Welcome to World Congress on Medical Physics & Biomedical Engineering 2015, Toronto, Canada

Kin-Yin Cheung, President of IOMP

On behalf of the International Organization for Medical Physics (IOMP), it is my great pleasure and honour extending my warmest welcome to all participants in this 13th World Congress on Medical Physics & Biomedical Engineering being held in the wonderful city of Toronto, Canada during June 6-12, 2015.

I wish to convey my gratitude to the Canadian Organization of Medical Physicists (COMP) and Canadian Medical and Biological Engineering Society (CMBES) for hosting this great event and to congratulate them for the huge success in this special occasion. The event provides a unique opportunity and a multi-disciplinary scientific platform for medical physicists, biomedical engineers, and other professionals from related fields from all over the world to exchange ideas and share their knowledge, experience, and research findings for the purpose of promoting human health through advances in science and technology in healthcare.

I would also like to congratulate the Congress Co-Chairs, Professor David Jaffray and Dr. Tony Easty, and their team members for putting up an outstanding congress with such an excellent scientific program. May I convey my appreciation to them for all their efforts and contributions in making this congress a most memorable one.

Last but not least, I wish all participants a very fruitful congress and an enjoyable stay in the beautiful city of Toronto.

Mahung

Kin-Yin Cheung, PhD President

IFMBE Welcome to the World Congress on Medical Physics and Biomedical Engineering 2015!

Each and every World Congress on Medical Physics and Biomedical Engineering is a chance for delegates from numerous countries from all over the world to review their own achievements and to have a closer look into the future of medical physics and biomedical engineering: which are the hottest topics in research, what can be expected from research results and from development, which are the new emerging technologies and what impact may be expected from them in medicine and health care, what are the highest needs for current care givers, how to make the education in medical physics and biomedical engineering better and more efficient. The World Congress is a platform for medical physicists and biomedical engineers to build a common policy for further improvement of health care and for planning common action under the umbrella of the International Union for Physical and Engineering Sciences in Medicine (IUPESM).

International Federation of Medical and Biological Engineering (IFMBE) is proud to be a sponsor of the World Congress this June, in Toronto, Canada. Biomedical engineers from most of more than 60 IFMBE affiliated Biomedical Engineering Societies will gather to exchange their knowledge and experience between themselves and also with colleagues who have their primary interest in medical physics, medicine and other professions linked with biomedical engineering. Contacts made at previous World Congresses enabled building of international research team which were successful gaining project in the field and where collaboration lasted for a long time. The Federation makes the most of the World Congress to reward distinguished scientists in biomedical engineering who have devoted their research for many years to biomedical engineering but at the same line, rewards early stage scientists and young investigators. There is more that 50 years since the Federation was founded (in 1959) and from the first World Congress in 1982, so that a whole crossection of careers in biomedical engineering evaluated.

I sincerely hope that all delegates of the Congress will gain from the scientific sessions and also that you all will enjoy the social activities of and around the Congress and of the appealing city of Toronto!

Ratko Magjarević, PhD President, IFMBE

Premier of Ontario - Première ministre de l'Ontario

June 7–12, 2015

A PERSONAL MESSAGE FROM THE PREMIER

On behalf of the Government of Ontario, I am delighted to extend warm greetings to everyone attending the IUPESM World Congress on Medical Physics and Biomedical Engineering in Toronto.

I would like to take this opportunity to commend the IUPESM for its commitment to supporting biomedical engineers and physicists in the ongoing advancement of these vital fields.

As Premier, I am proud that Ontario has the opportunity to host an event that facilitates fruitful discourse between clinicians, researchers, educators and practitioners with the noble aim to improve global health outcomes. With an impressive array of lectures, educational sessions and workshops, this conference is sure to both enlighten and inform.

I would also like to thank IUPESM for choosing our province to host this wonderful event. I am confident that all the delegates and guests will enjoy their time in Toronto, our vibrant and diverse capital city.

Please accept my best wishes for an informative and memorable congress.

athlen augure

Kathleen Wynne Premier

CMBES/SCGB

Welcome / Bienvenue

On behalf of the Canadian Medical and Biological Engineering Society, I would like to welcome each of you to Toronto for the World Congress on Medical Physics and Biomedical Engineering.

The committee organizers and countless volunteers have worked hard to put forward a great program including an impressive line-up of educational courses.

I would like to extend my appreciation for the support of the Sponsors and Exhibitors who will be on hand Sunday evening through Thursday to market their latest products and services. Please spend some time at the Exhibit Hall to see what's new and improved.

Note that CMBES is celebrating its 50th anniversary this year. We have an amazing and rich history founded by innovators, scientists, and biomedical/clinical engineers, who uniquely served patients, the medical community, and Canadian Healthcare.

Please enjoy the learning and sharing with colleagues from the international community over the next few days and don't forget to join us for the Gala dinner on Wednesday night and the AGM on Thursday evening. I also hope you have a little bit of spare time to enjoy some of the sights around Toronto.

Au nom de la Société Canadienne de Génie Biomédical, j'aimerais souhaiter la bienvenue à chacun de vous à Toronto pour le Congrès Mondial sur la physique médicale et le génie biomédical.

Les organisateurs du comité et les innombrables bénévoles ont travaillé très fort pour mettre de l'avant un excellent programme qui inclut également un nombre impressionnant de cours de formation continue.

Je tiens à exprimer ma gratitude pour le soutien des commanditaires et des exposants qui seront sur place du dimanche soir au jeudi pour présenter leurs plus récents produits et services. N'oubliez pas, s'il vous plaît d'en profiter pour prendre quelques minutes pour aller au salon des exposants afin de découvrir les dernières nouveautés et améliorations.

Notez que le CMBES célèbre son 50e anniversaire cette année. Nous avons une histoire étonnante et riche fondée par les innovateurs, les scientifiques et les ingénieurs cliniques et biomédicaux, qui ont concentré leurs efforts pour apporter des bénéfices pour la santé les patients, la communauté médicale et le système de santé canadien.

Je vous souhaite une bonne conférence et j'espère que vous profiterez de cette occasion d'apprendre et de partager avec les collègues de la communauté internationale au cours des prochains jours. N'oubliez pas de nous rejoindre pour le dîner de gala du mercredi soir et l'Assemblée Générale du jeudi soir. Enfin, j'espère aussi que vous trouverez un peu de temps libre pour profiter de certains des attraits touristiques de Toronto et sa région.

Sincerely,

Martin Poulin, M.Eng., P.Eng. President, CMBES/SCGB

Dear Delegates of the 2015 World Congress on Medical Physics and Biomedical Engineering,

On behalf of the Canadian Organisation of Medical Physicists and the Medical Physics community in Canada, Welcome to Toronto!

The theme for this year's World Congress is "Health * Technology * Humanity". I believe this captures the spirit of this meeting, and explains why it is so important that Medical Physicists and Biomedical Engineers meet together, and on a world scale. Medical technology is increasingly central in patient care; we as Physicists and Engineers are uniquely trained and able to improve human health through technology. The World Congress is the most comprehensive medical technology meeting in the world; this year we are welcoming delegates from 89 countries from all corners of the world to come to Toronto and share our knowledge and ideas to help improve human health for everyone.

COMP is very pleased to be able to contribute to improving global health through our contributions to this meeting. The planning for this meeting has been underway in earnest for about 20 months now, and we are grateful for the many volunteers who have committed much time and effort to plan this meeting for you. COMP is also grateful to our partner organisation in this event, the Canadian Medical and Biological Engineering Society, for co-organising the event with us. I believe that both societies are benefited tremendously through the interactions and planning with our partners. We are also grateful to the World Organisations, the IUPESM, IOMP and IFMBE, for giving us the opportunity to plan the premier Medical Physics and Biological Engineering conference in the world. It has been a privilege to host this event, and we are proud to be able to bring it to you.

I would like to reserve my greatest thanks to you, the delegates attending this meeting. This meeting will offer a world class program of talks and education sessions, covering 19 different tracks that could not be possible without your contributions. Without your hard work, commitment and enthusiasm for medical technology, this meeting would not be possible.

Thank you for making the trip to Toronto, and enjoy the meeting!

Marco Carlone, PhD President, COMP

HOSTS & COMMITTEES

► HOSTS

International Union for Physical and Engineering Sciences in Medicine (IUPESM)

The IUPESM represents the combined efforts of more than 40,000 medical physicists and biomedical engineers working on the physical and engineering science of medicine. The principal objectives of IUPESM are: (a) to contribute to the advancement of physical and engineering science in med-

icine for the benefit and wellbeing of humanity; (b) to organize international cooperation and promote communication among those engaged in health-care science and technology; (c) to coordinate activities of mutual interest to engineering and physical science within the health care field, including international and regional scientific congresss, seminars, working groups, regional support programs and scientific and technical publications; (d) to represent the professional interests and views of engineers and physical scientists in the health-care community.

International Organization for Medical Physics (IOMP)

The IOMP represents over 18,000 medical physicists worldwide, 80 adhering national member organizations and 6 regional organizations.

The mission of IOMP is to advance medical physics practice worldwide by disseminating scientific and technical information, fostering the educational and professional development of medical physicists, and promoting the highest quality medical services for patients.

International Federation of Medical and Biological Engineering (IFMBE)

IFMBE is primarily a federation of national and transnational organizations. These organizations represent national interests in medical and bio-

logical engineering. The objectives of the IFMBE are scientific, technological, literary, and educational. Within the field of medical, biological and clinical engineering IFMBE's aims are to encourage research and the application of knowledge, and to disseminate information and promote collaboration.

Canadian Organization of Medical Physicists (COMP)

COMP is the main professional body for medical physicists practicing in

Canada. The membership is composed of graduate students, professional physicists, scientists, and academics located at universities, hospitals, cancer centers, and government research facilities. Every member has an educational or professional background in physics or engineering as it applies to medicine. COMP's vision is to be the recognized leader and primary resource for medical physics in Canada. COMP's mission is to champion medical physicists' efforts for patient care excellence through education, knowledge transfer, advocacy and partnerships.

Canadian Medical and Biological Engineering Society (CMBES)

CMBES is Canada's principal society for engineering in medicine and biology. The Society's aims are twofold: scientific and educational: directed

toward the advancement of the theory and practice of medical device technology; and professional: directed toward the advancement of all individuals in Canada who are engaged in interdisciplinary work involving engineering, the life sciences and medicine.

CONGRESS

The IUPESM World Congress 2015 will take place in the South Building of the Metro Toronto Convention Centre. The Convention Centre is located in the heart of downtown Toronto. The South Building is accessible via Bremner Boulevard as well as from the North Building via Front Street.

Metro Toronto Convention Centre

South Building 222 Bremner Boulevard, Toronto, Ontario, Canada M5V 3L9

Toronto, Ontario, Canada

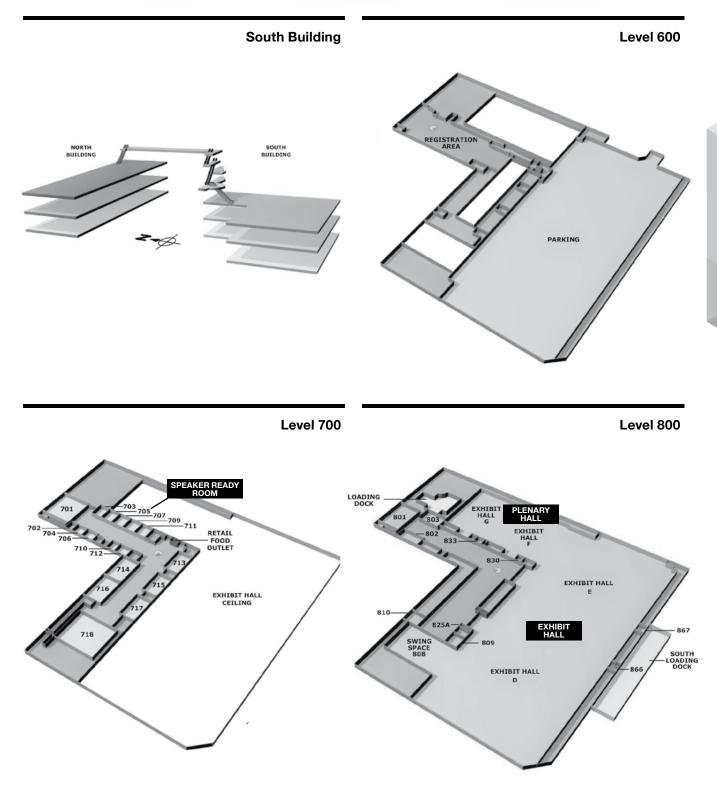

One of Canada's best kept secrets, Toronto is on par with New York City, San Francisco and Chicago when it comes to cultural attractions and urban sophistication.

The landmark CN Tower is the tallest freestanding structure in the world. Take the elevator to the top for a breathtaking view of the city, Lake Ontario and more. Stroll next door and experience Ripley's Aquarium as you explore the wonders of the sea or a catch a Blue Jays Baseball game at Rogers Centre or just walk around the massive engineering marvel. Check out the Royal Ontario Museum, the largest in Canada with its fascinating archaeology and natural history exhibits, and the Art Gallery of Ontario, with a fine collection of European and Canadian works. You won't want to miss the electric shops and restaurants on Queen Street West or the elegant boutiques and fine restaurants in Yorkville.

And there's more: harbour front is a complex of unique shops and restaurants right on beautiful Lake Ontario. From harbour front you can hop on a ferry to the Toronto Islands for a picnic and outdoor recreation such as beach volleyball.

Explore the area and take a day trip to another wonder of the world and experience Niagara Falls or take a break right next door and experience Ontario's wine country. Toronto and the surrounding areas are a great family destination and most attractions are child-friendly. The city itself is clean, safe and easy to explore either on foot or by public transportation.

CONGRESS **VENUE**

ADOPT A DELEGATE

The IUPESM 2015 World Congress is proud to support the 'Adopt a Delegate/Student' initiative, giving prospective delegates from a developed world setting the opportunity to adopt or part finance the registration and accommodation costs of a peer from an emerging economy.

► We would like to thank the following people for their consideration and support:

Herbert F. Voigt David Rogers David Jaffray Modus Medical Devices Inc. Murray Rice Grace Zeng Wiliam Gentles Raymond Wu Ichiro Sakuma David Spencer Vincent Lam Joyce Shen Tony Easty

SCIENCE FAIR YOUTH OUTREACH

Winners of a local science fair have been invited to participate in the IUPESM 2015 Youth Outreach Program. 26 youths between the ages of 15–18 will present their 18 Science Fair projects on Wednesday, June 10.

They will start their day by listening to the Key Note Session by Gordon MCBean and Mary Gospodarowicz, followed by attending the session on "What is a medical physicist? What is a biomedical engineer?" After, they are taken on a guided tour of selected posters and the exhibit floor by a Professor. After lunch, their day concludes by presenting their Science Fair projects in the Exhibit Hall, interacting with congress delegates.

REGISTRATION INFORMATION

Registration Counter Hours

Registration is located on Level 600, South Building of Metro Toronto **Convention Centre.**

Sunday, June 7	11:00 – 20:00
Monday, June 8	07:00 - 17:30
Tuesday, June 9	07:00 - 17:30
Wednesday, June 10	07:00 - 17:30
Thursday, June 11	07:00 - 17:30
Friday, June 12	07:00 - 13:00

The Toronto Information Desk is located in the Registration area on Level 600, South Building of Metro Toronto Convention Centre. Staff will

provide local information and assist with:

- Ground Transportation
- Airport Transfers
- Sightseeing Tours
- Pre- and Post Tours
- Restaurant recommendations and booking
- Local PA and Personal Concierge Services

Delegate Help Desk

Delegate Help Desk is located on Level 600, South Building of Metro **Toronto Convention Centre.**

Sunday, June 7	11:00 – 20:00
Monday, June 8	07:00 - 17:30
Tuesday, June 9	07:00 - 17:30
Wednesday, June 10	07:00 - 17:30
Thursday, June 11	07:00 - 17:30
Friday, June 12	07:00 – 13:00

If you require assistance or any information regarding the Congress, please see the staff at the Delegate Information Counter located in the registration area, on Level 600, South Building of Metro Toronto Convention Centre.

Registration Materials

Registration Materials include:

- Name Badge
- Delegate Bag Voucher (not included in Accompanying Person Registration)
- Onsite Program Book Voucher

Delegate Bag Booth

Delegate Help Desk is located on level 600, South Building of Metro **Toronto Convention Centre**

Sunday, June 7	11:00 – 20:00
Monday, June 8	07:00 – 17:30
Tuesday, June 9	07:00 – 17:30

Delegate Bags include:

- Invitation Flyers for Industry Supported Symposia
- Additional Promotional Flyers from Sponsors and Exhibitors

SUPPORTED BY

Name Badges

Delegates and guests are requested to wear their name badge at all times in order to participate in the Scientific Sessions, Social Events and Exhibition.

Lost Badge/Name Changes:

A 50 CAD fee applies for any reprints due to onsite name changes or lost badges.

Badge Color Identification

Delegate – Blue

- Access to all Scientific Program & Continuing Education Sessions (except any specially ticketed sessions)
- Access to Exhibit Hall
- Congress Bag
- Onsite Program and Congress Handouts

INFORMATION FOR SPEAKERS & PRESENTERS

Speaker Ready Room

All invited speakers as well as oral abstract presenters are required to report to the Speaker Ready Room at least 24 hours prior to their scheduled presentation in order to upload their presentation slides or to check their previously uploaded slides. Computers are available to preview and upload presentations. Presenters should make sure all fonts appear as expected. No file submissions will be accepted in the session rooms.

The Speaker Ready Room is located in Room 705 on Level 700.

Sunday, June 7	11:00 – 20:00
Monday, June 8	07:00 - 17:30
Tuesday, June 9	07:00 - 17:30
Wednesday, June 11	07:00 - 17:30
Thursday, June 12	07:00 - 17:30
Friday, June 12	07:00 – 13:00

Invited Speakers and Oral / Abstract Presenters

All speakers are asked to be in the session room at least 10 minutes prior to the start of their session.

Poster Presenters

All Poster Presentations/Boards are located in Hall E on Level 800, South Building of Metro Toronto Convention Centre.

Each Poster Board will be shared by two posters on each side. The Poster Boards are identified with Poster Numbers that correspond with the pre-assigned Poster Numbers for each poster presentation. The Poster Numbers are also published in this program book and in the Online Abstract Book.

Poster set up time:	Sunday, June 7	15:00 – 17:45
Poster take down:	Thursday, June 11	17:00 – 19:00
(any posters not removed by 19:00 will be discarded by management))

Poster Sessions

Posters will be displayed at all times during the Exhibit Opening Hours each day starting Sunday June 7. Presenters are asked to stand by their poster during the following times to informally answer questions from Congress delegates:

Morning & afternoon Networking Breaks:

10:00 - 10:30 AND 16:30 - 17:00 Monday, June 8 to Thursday, June 11.

► During the Welcome Reception: 18:00 – 20:00 on Sunday, June 7.

ONSITE SERVICES & GENERAL INFORMATION

Abstracts

All accepted and confirmed abstracts are published in the IUPESM World Congress Onsite Program and Abstract Book. This will be available on the Congress website.

All Full Papers accepted by the World Congress will be published by Springer in the IFMBE Proceedings 2015.

Delegate Lounges

Canadian Nuclear Safety Commission Commission canadienne de súreté nucléaire

> VAR JAN medical systems

The delegate lounges are located in the Exhibit Hall, see floorplan page 35.

Internet Café

SUPPORTED BY

The internet café is located in the Exhibit Hall.

Wireless Internet

Wireless internet is available in the public areas of the venue but not the meeting rooms or the Exhibit Hall.

Charging Station & Lounge

The charging station & lounge is located in the Exhibit Hall.

Congress Signage

Water Stations

Welcome Reception

SUPPORTED BY

All delegates are invited to attend the Welcome Reception on Sunday June 9 at 18:00 in the Exhibit Hall.

Lost and Found

Lost and found items should be returned/claimed at the registration desk.

Lunch

Lunch will not be provided by the Congress. However, there are plenty of restaurant choices in the area. A café, a convenience store and vending machines are all located within the Centre and there are also numerous restaurant options within a few minutes walk of the Convention Centre:

 SOCO Kitchen + Bar Located within the Delta Hotel offers laid back style of eating, with the opportunity to look over Bremner Street on their patio.

- Pita & Grill For a lighter meal head to Pita & Grill for a grab and go option.
- 360 Restaurant Upmarket Dining with sky high view in the world famous CN Tower.

Networking Breaks

Networking Breaks (hot beverages and snacks) are served on Level 700 at the following times:

CAMPEP Accrediation

For Medical Physicists:

The IUPESM 2015 World Congress Continuing Education Program is CAMPEP Accredited for up to 82 MPCEC credits. If you will be applying to CAMPEP for your MPCEC credits following the Congress and have not already paid the \$11(CAD) CAMPEP fee then you will be able to pay this fee at the registration desk during registration hours. After the Congress you will be contacted by CAMPEP regarding Accreditation.

For Biomedical Engineers:

The IUPESM 2015 World Congress Continuing Education Program can be used for points towards Clinical Engineering Certification Renewal.

SOCIAL EVENTS

Be sure to join us for these events during the week:

► Welcome Reception

SUPPORTED BY

Sunday, June 7, 2015

18:00 – 20:00 Exhibit Hall E

Enjoy some light hors d'oeuvres and a beverage, along with a subdued jazz trio, as you connect with exhibitors. This is your opportunity to network and connect with industry colleagues.

Opening Ceremony & President's Welcome Address

Monday, June 8, 2015 10:30 – 12:00 Exhibit Hall F/G

Your opening ceremony and president's welcome address will be greeted by Canadian inspired entertainment, followed by the formalities of any President's Welcome Address. You will hear all about what you can expect to experience throughout the congress and Toronto as your host city!

► Gala Dinner

Wednesday, June 10, 2015

19:00 – 23:00 Exhibit Hall F/G

After a busy week at the congress, tonight you will enjoy a delicious meal with fellow colleagues and new friends. Roaming entertainment will emerge throughout the evening and an upbeat band will perform top hits after dinner so you can show off your dancing moves.

Closing Ceremony & Awards Presentation

Friday, June 12, 2015 15:00 – 16:00 Exhibit Hall F/G

Final remarks from the President, the organizing committees and your incoming officers will be announced here! Be sure to attend to hear where the next congress location will take place!

SOCIAL

Explore the area and take a day trip to experience one of the world wonders Niagara Falls or take the half day, fun and informative Toronto City Tour.

Niagara Falls Tour

The premium full-day tour of the Falls starts with your hotel pickup in the morning. On our first stop we'll have time to explore Niagara-on-the-Lake.

www.niagarafallstourism.com/about/niagara-on-the-lake/

"NOTL" Niagara-on-theLake is a picturesque town just a few minutes drive outside of Niagara Falls. You'll enjoy 40 minutes taking pictures and exploring some of the unique shops. Before you actually reach the Falls, we'll also see the Floral Clock, Niagara River and whirl pool, Sir Adam Beck Power Station, Queenston Heights, and the Spanish Aero Car. During the day, we will make a stop at one of Niagara Falls' famous wineries. There you will have an opportunity to sample wine before continuing our Niagara Falls adventure. The tour is structured to give you 2-3 hours of free time at the Falls. This gives you plenty of time to add in additional activities you want to do, plus stop for lunch, which is on your own time and budget. Recant the day's memories on the bus ride back until you're dropped back at your hotel doorstep.

Toronto City Tour

The half day, fun and informative Toronto City Tour will transport you to some of the city's most popular sights as you relax aboard our new air-conditioned bus. We will show you over 17 attractions. Our stops include the St. Lawrence Market where you can buy lunch and a stroll through the pedestrian friendly Distillery District.

Shopping Tour

www.premiumoutlets.com/outlets/outlet.asp?id=109

Toronto Premium Outlets features a high end collection of the finest brands for you, your family and your home. Our Tour bus will pick you up from your hotel I obby between and take you the Outlets just 45 minutes outside of Toronto. Once we arrive you will receive a VIP Coupon book plus a special gift just for you from Toronto Premium Outlets management team.

Please go to our website for more details or to book a tour: wc2015.org/events-tours/pre-post-tours/

EXHIBIT INFORMATION

Location

Hall E on Level 800, South Building of Metro Toronto Convention Centre.

Exhibit Hours

Sunday, June 7	18:00 – 20:00
Monday, June 8	09:30 – 17:00
Tuesday, June 9	09:30 – 17:00
Wednesday, June 10	09:30 – 17:00
Thursday, June 11	09:30 – 17:00

Exhibit Features

- Exhibit Information Booth
- Show Service Provider Desk
- Internet Café
 SUPPORTED BY

Charging Station & Lounge
 SUPPORTED BY

- Food & Beverage Stations
- Delegate Lounges

EXHIBIT FLOOR PLAN

EXHIBITOR BIOGRAPHIES

Accuray | Booth # 3104

Accuray Incorporated is company that develops,

manufactures and sells precise, innovative tumor treatment solutions that set the standard of care with the aim of helping patients live longer, better lives. The company's leading-edge technologies deliver the full range of radiation therapy and radiosurgery treatments.

American Association of Physicists in Medicine (AAPM) | Booth # 1212

The mission of AAPM, a professional organization of 8,400+ members, is to advance the science, education and professional practice of medical physics. Visit booth #1212 for information on AAPM programs, to see a demonstration of the Virtual Library

and to pick up complimentary copies of the Medical Physics journal.

ANDA Medical | Booth # 3604

ANDA Medical provides new and refurbished medical equipment to the global community. By

locating medical products from the finest health facilities around the world, we maintain strong relationships with hospitals, medical suppliers, and OEMs. With consistent access to high-quality medical equipment we provide our customers with products at a fraction of the cost. This is our top priority.

ArjoHuntleigh Canada Inc. | Booth # 3213

A medical device company offering GETINGE GROUP innovative solutions in

Patient Handling, Therapeutic Surfaces, Medical Beds, Hygiene and Disinfection. ArjoHuntleigh offers programs to ensure facilities meet their needs while providing safe and efficient care.

Bayer Healthcare | Booth # 3503

Bayer HealthCare Enterprise Platform is

Bayer's Radimetrics™ an integrated

radiation dose and contrast dose* management solution. Platform tools can help customers drive compliance, efficiency and reproducible quality. Customizable dashboards facilitate enterprise-wide analytics and protocol management. With industry-leading repair capabilities, guality, and customer care, Multi Vendor Service provides the best value in third-party service.

*Requires Medrad® Stellant® CT Injection System/Certegra® Workstation

Best Theratronics | Booth # 3303

Best Theratronics Ltd. is a Canadian component of TeamBest[™]. We manufacture external beam therapy units (Equinox[®], GammaBeam[®] 100-80, and the new GammaBeam®

500 Total Body Irradiator), blood and research irradiators (Gammacell® 1000 & 3000, Raycell® Mk2, Gammacell® 40E, GammaBeam® X200), and variable energy cyclotrons for radioisotope production and research.

Biomedical Engineering Society (BMES) | Booth # 2709TT

The Mission of the BMES is to build and support the biomedical engineering

community, locally, nationally and internationally, with activities designed to communicate recent advances, discoveries, and inventions; promote education and professional development; and integrate the perspectives of the academic, medical, governmental, and business sectors.

BRACCO® IMAGING Canada | Booth # 2301

BRACCO[®] IMAGING Canada, world leader in medical imaging presents the latest contrast injection technologies in Radiology and Cardiac CathLab with ACISTCVi™, CTExpres3D™ syringeless injector, and EmpowerCTA+™, with

LIFE FROM INSIDE Nexo[™] Contrast management and NexoDose[™] Radiation Dose softwares. BIC distributes Invivo Corporation technologies (MR compatible patient monitoring, DynaCAD Breast and Prostate, UroNav fusion biopsy system, etc)

Brainlab Technology | Booth # 1102

Brainlab technology radiosurgery as well as

numerous surgical fields including neurosurgery, orthopedic, ENT, CMF, spine and trauma. Founded in Munich in 1989, Brainlab has over 8,900 systems installed in about 100 countries.

Canadian Medical and Biological Engineering Society | Booth # 2305

The Canadian Medical and Biological Engineering Society is Canada's principal society for engineering in medicine and biology. The Society's mission is to advance and promote the

CMBES/SCGB theory and practice of engineering

sciences and technology to medicine and biology, serving as a forum for information exchange between healthcare professionals, scientists, and the general public.

Please stop by the CMBES booth # 2513 to find out more about our role, programs, networking opportunities and the 2016 Congress in May, 2016 in Calgary, Alberta.

Canadian Nuclear Safety Commission | Booth # 1228

The Canadian Nuclear Safety Commission, Canada's independent nuclear regulator, regulates the use of nuclear energy and materials to protect health, safety,

security and the environment and to implement Canada's international commitments on the peaceful use of nuclear energy; and to disseminate objective scientific, technical and regulatory information to the public.

Canadian Organization of Medical Physicists Booth # 1115

The Canadian Organization of Medical Physicists is the

professional body for medical physicists in Canada. The membership is composed of physicists, scientists and academics located at universities, hospitals, cancer centres and government research facilities as well as graduate students and post-doctoral fellows. Members have an educational or professional background in physics or engineering as it applies to medicine.

CareFusion | Booth # 2202

At CareFusion, we serve the healthcare industry has joined BD with products and

services that support infection prevention, medication management, operating room efficiency, respiratory care and healthcare analytics products and services. As of March 2015, CareFusion has joined BD to become one of the largest global leaders in the medical technology industry.

Carleton University | Booth # 3406

Carleton University, located in Canada's beautiful capital city Ottawa, offers an MASc in biomedical engineering, and MSc and PhD Physics with

Canada's Capital University

specialization in medical physics (the PhD is CAMPEP accredited). Our programs are networked with world-class clinical facilities and national laboratories making Carleton a stimulating academic and research environment.

Carleton University, located in Canada's beautiful capital city Ottawa, offers an MASc in biomedical engineering, and MSc and PhD Physics with specialization in medical physics (the PhD is CAMPEP accredited). Our programs are networked with world-class clinical facilities and national laboratories making Carleton a stimulating academic and research environment. carleton.ca

CDR Systems | Booth # 1127

A global company CDR Systems offers proven next generation Frameless SRS, SRT, IMRT,

IGRT, SBRT, Breast, Pelvis and H&N precision patient positioning and Immobilization products used by leading organizations worldwide. See why at our booth or email to arrange a demo. You can also keep in touch with the latest advancements in patient immobilization at: twitter.com/ CDRSystems and online www.cdrsys.ca

Centre for Imaging Technology Commercialization (CIMTEC) | Booth # 2211

CIMTEC builds and tests clinical prototypes in the broad areas of 3D visualization, image analysis and mecha-

tronics design with specific expertise in image-guided interventions and digital pathology. Through technology development, business advice, and clinical testing, CIMTEC helps researchers, startups and small to medium-sized companies commercialize their medical imaging innovations.

CIRS | Booth # 1224

CIRS is recognized world wide for tissue simulation technology

Tissue Simulation & Phantom Technology

and is the leader in the manufacture of phantoms and simulators for radiation therapy QA and dosimetry, diagnostic imaging and quality assurance as well as training and demonstration phantoms for CT, mammography, ultrasound, MRI, radiation therapy, fluoroscopy, radiography and emerging modalities.

Covidien | Booth # 2203

Covidien is a leading global healthcare products company

that creates innovative medical solutions for better patient outcomes and delivers value through clinical leadership and excellence. Please visit www.covidien.com to learn more about our business.

CRC Press | Booth # 1107

CRC Press/Taylor and Francis is a leading international publisher of references, textbooks and

professional handbooks in medical physics and biomedical engineering. Visit our booth to browse and enter to receive special prizes and discounts on new and bestselling titles. Editors Francesca McGowan (francesca.mcgowan@tandf. co.uk) and Michael Slaughter (Michael.Slaughter@taylorandfrancis.com) will be available to discuss new project ideas.

Department of Radiation Oncology, University of Toronto | Booth # 1114

Radi UN

Radiation Oncology UNIVERSITY OF TORONTO

The Accelerated Education Program is putting innovation to work through

education dedicated to promoting essential aspects of clinical care. Learning environments are engaging, creative and interactive, putting the focus on interprofessional activities that enhance team work. The goal of AEP is to deliver relevant, excellent programming for all radiation medicine professionals.

Dräger | Booth # 2110

As an international leader in medical and safety technology, Dräger develops innovative equipment and solutions that

people the world over trust. No matter where Dräger products are used, it's always about life. Whether for use in the OR, ICU or Neonatal Care, Dräger products protect, support and save lives.

Dunlee | Booth # 2204

For over 65 years, Dunlee has remained at the forefront of medical imaging as an interna-

tional leader in research, design, and manufacturing of high-performance replacement tubes for CT and general radiography. We also offer Technical Webinars and the Dunlee App, which features the Dunlee Academy, a virtual tube installation guide.

ECRI Institute | Booth # 2711TT

ECRI Institute is an independent nonprofit with more than 40 years of experience

researching the best approaches to improving patient care. Our unbiased, evidence-based research, information, and advice help you address patient safety, quality and risk management challenges, procure cost-effective technology, and align capital investments with strategic technology needs.

Elekta | Booth # 1202

Elekta is a human care company pioneering significant innovations and clinical solutions for treating cancer

and brain disorders. The company develops sophisticated, state-of-the-art tools and treatment planning systems for radiation therapy, radiosurgery and brachytherapy, as well as workflow enhancing software systems across the spectrum of cancer care.

Engineering World Health | Booth # 2713TT

Engineering World Health works with students and the BME community to improve healthcare delivery in developing world hospitals. We build local capacity to maintain medical equipment, make repairs, and develop

engineeringworldhealth www.ewh.org

low-cost technologies. Visit us to learn about our Summer Institute and making a lasting impact on developing world health care!

Fibertech | Booth # 2503

FIBERTECH

Since 1994, Fibertech continues to be the number #1 hospital

equipment service facility in Canada. Specializing in repair of flexible and rigid endoscopes, rigid instrumentation, power tools and phaco hand pieces. Training and education programs provide a complete experience for our customer.

Fluke Biomedical / Unfors RaySafe | Booth # 3112

Biomedical

Together Fluke Biomedical and Unfors RaySafe strive to improve the quality of global health, one measurement at a

time. We provide most reliable quality assurance solutions to make medical equipment safer to use. We serve biomedical engineers, guality-assurance technicians, medical physicists, oncologists, and radiation-safety professionals. For more information, visit www.flukebiomedical.com.

GCX Corporation | Booth # 2505

GCX Corporation - the worldwide leader in medical instrument mounting solutions. Over forty years of industry experi-

ence has given us a unique understanding of the interaction between medical devices, users, and healthcare environments. We partner with you to create mounting products that enable caregivers to deliver improved patient care.

GE Healthcare | Booth # 2302

GE (NYSE: GE) imagines things others don't, builds things others can't and delivers outcomes that

make the world work better. GE brings together the physical and digital worlds in ways no other company can. In its labs and factories and on the ground with customers, GE is inventing the next industrial era to move, power, build and cure the world. www.ge.com

Getinge Group | Booth # 3114

GETINGE GROUP

Getinge is a leading global GETINGE Getinge is a leading global medical technology company with operations in the areas of surgery, intensive care, infection

control, care ergonomics and wound care. Getinge provides equipment, systems and solutions that aims to contribute to quality enhancements and cost efficiency within healthcare and the life sciences.

Harpell Associates | Booth # 3305

Harpell Associates is a company dedicated to selling high quality healthcare care

products, and services to Radiation Oncology, Nuclear and Radiological imaging centers throughout Canada. With over 35 years of experience in the Canadian health care industry we have developed a reputation of providing outstanding customer service throughout the industry.

Heidelberg University | Booth # 1111

Heidelberg University, founded in 1386, is the oldest University in Germany with a strong

international orientation. In 2010 the first postgraduate distance learning Master program the "Master Online Advanced Physical Methods in Radiotherapy (APMR)" was launched. Since then additional distance learning programs in the field of Medical Physics have topped off the offer.

IBA | Booth # 1331

IBA is a global medical technology company focused on bringing integrated and innovative solutions for the diagnosis and treatment of cancer. The Company is the worldwide technology

leader in the field of proton therapy. IBA also has a radiation dosimetry business and develops particle accelerators for the medical world and industry.

IEEE Engineering in Medicine and Biology Society | Booth # 2104

IEEE Engineering in Medicine and Biology Society is the world's largest society of biomedical engineers. We provide access to people, practices, information, ideas and opinions shaping one of

the fastest growing, technical fields. EMBS focuses on development and application of engineering concepts/ methods to provide solutions to medical and healthcare problems.

Institution of Engineering and Technology | Booth # 2715TT

The IET journals portfolio offers high quality research in a number of topic areas including medical and biomedical research.

Healthcare Technology Letters, IET Image Processing, IET Nanobiotechnology and IET Systems Biology are all key journals in this fast-paced field and considered an invaluable source for researchers and practitioners. Find out more at www.ietdl.org/journals.

International Federation for Medical and Biological Engineering (IFMBE) | Booth # 2309

The International Federation for Medical and Biological Engineering (IFMBE) is primarily a federation of national and transnational

societies. These professional organizations represent interests in medical and biological engineering. The IFMBE is also a Non-Governmental Organization (NGO) for the United Nations and the World Health Organization (WHO), where we are uniquely positioned to influence the delivery of health care to the world through Biomedical and Clinical Engineering.

International Organization for Medical Physics (IOMP) | Booth # 1119

International Organization for Medical Physics (IOMP) represents over 18,000 medical physicists worldwide and 80 national member organisations.

The mission of IOMP is to advance medical physics practice worldwide by disseminating scientific and technical information, fostering the educational and professional development of medical physicists, and promoting the highest quality medical services for patients.

International Union for Physical and Engineering Sciences in Medicine (IUPESM) | Booth # 3214

IUPESM is a non-profit scientific NGO. The founding constituent organizations are IFMBE and IOMP. The objective is to contribute to the advancement of physical and engineering science in medicine for the well-being of humanity. IUPESM is the custodian of the triennial World Congress

for Medical Physics and Biomedical Engineering.

IOP Publishing | Booth # 1103

IOP Publishing (ioppublishing. journals, books, websites,

magazines, congress proceedings and services through which leading-edge scientific research is distributed worldwide. Visit our stand to find out more about IOP Biosciences - our journals publishing in a number of fields, including medical physics, biomedical engineering and biophysics.

IPEM | Booth # 3606

The Institute of Physics and Engineering in

Medicine (IPEM) is dedicated to bringing together physical science, engineering and clinical professionals in academia, and healthcare to share knowledge, advance science / technology and inform / educate the public with the purpose of improving the understanding, and treatment of disease and management of patients.

iRT Systems | Booth # 1124

iRT is a new company founded in 2013 to introduce innovative new products into the radiation therapy market with the goal to improve patient safety and the overall quality of treatment.

Our first project is the development and certification of the Integral Quality Monitor (IQM) System, a revolutionary new device for real-time quality assurance.

LAP Laser | Booth # 1214

LAP of America Laser Applications, L.L.C has been delivering state of the art patient alignment laser systems for radiation therapy, nuclear medicine, and diagnostic radiology since 1997. Building on a strong tradition of

excellence in the medical industry LAP has become the world leader in patient alignment laser systems.

Maquet-Dynamed | Booth # 3211

MAQUET-DYNAMED

MAQUET is a subsidiary of the publicly listed

Swedish Group of companies GETINGE AB. The MAQUET brand represents the Medical Systems Business area and together with two other Business Areas ARJO Extended Care and GETINGE Infection Control, the entire GETINGE group of companies focuses on forward –looking medical technology.

MedTech Hub | Booth # 3203, 3206

ACMIT | Booth # 3203, 3206

ACMIT is a translational research center focused on technology for minimally invasive surgery that combines multidisciplinary know-how with that of international experts. The organizational

structure of ACMIT reflects the quest for scientific excellence and successful technology development. ACMIT's goal is to bring developments to their real use in clinical context within reasonable time.

CTMH | Booth # 3203, 3206

CTMH is collaboration between Karolinska

Institutet, Royal Institute of Technology and Stockholm County Council to help develop the region as a worldclass medical technology center. CTMH creates venues and activities that stimulate and develop exchanges between industry, academia and health care in the boundaries between technology, health, research and application.

Hong Kong Science & Technology Parks Corporation (HKSTP) | Booth # 3203, 3206

Comprising Hong Kong Science Park, InnoCentre and Industrial Estates, Hong Kong Science & Technology Parks Corporation

(HKSTP) is a statutory body dedicated to building a vibrant innovation and technology ecosystem to connect stakeholders, nurture technology talents, facilitate collaboration, and catalyse innovations to deliver social and economic benefits to Hong Kong and the region.

Institute of Biomedical Engineering | Booth # 3203, 3206

The Institute of Biomedical Engineering is a leading university-based deliverer of medtech R&D and innovation.

The IBME brings together businesses, clinicians and academics to establish the technical feasibility, clinical desirability and commercial viability of cutting edge medical technology. We're pioneering this engagement through both our MedTech Accelerator Programme and our PhD training scheme.

Medical Valley EMN | Booth # 3203, 3206

The Medical Valley EMN (e.V.) association assumes key tasks in the medical technology cluster and supports all members with comprehensive

services. The association facilitates knowledge exchange, promotes the cluster internationally, and supports start-up companies. The overall goal is to develop the EMN area into a model region for optimal healthcare.

Morgridge Institute for Research | Booth # 3203, 3206

The Morgridge Institute for Research is a private, nonprofit biomedical research institute in Madison, Wis., affiliated with the University

of Wisconsin–Madison. The institute works to improve human health by conducting, enabling and translating interdisciplinary biomedical research. Current research includes regenerative biology, virology, medical engineering and core computational technology.

Ontario Brain Institute | Booth # 3203, 3206

The Ontario Brain Institute is a provincially-funded, not-for-

profit research centre seeking to maximize the impact of neuroscience and establish Ontario as a world leader in brain research, commercialization and care. We create partnerships between researchers, clinicians, industry, patients, and their advocates to foster discovery and deliver innovative products and service.

Sunnybrook Research Institute | Booth # 3203, 3206

Sunnybrook Research Institute (SRI) is the research enterprise of Sunnybrook Health

Sciences Centre and is affiliated with the University of Toronto. Scientists at SRI strive to understand and prevent disease, and to develop treatments that enhance and extend life. They are renowned for excellence in the biological, physical and evaluative clinical sciences.

Techna | Booth # 3203, 3206

Techna is an institute of University Health Network, in collaboration with the

University of Toronto, focused on the accelerated development and exploitation of technology for improved health. Techna is designed to shorten the time interval from technology discovery to application through a continuum of clinically driven innovation, technology & process development.

Thunder Bay Regional Research Institute (TBRRI) | Booth # 3203, 3206

Thunder Bay Regional Research Institute

Established in 2007 as Canada's newest molecular imaging and advanced diagnostics research institute, TBRRI is now the research arm of the

In partnership with r Bay Regional Health Sciences Centre

Thunder Bay Regional Health Sciences Centre. Currently Scientists, Physician Researchers and Clinicians are engaged in research which contributes to innovative treatments and improved diagnostic tools.

MedView Technologies | Booth # 2213

MedView was founded in 2013 to commercialize a highly innovative & proprietary technology

based on Spatially Resolved Diffusive Reflectance Spectroscopy, with potential applications in the medical diagnostics, pharmaceutical manufacturing, and food/material inspection fields. We are currently developing a vein detection medical device, with potential market size of up to \$4B.

MIM Software Inc. | Booth # 2205

MIM Software Inc. provides practical imaging solutions in the fields of radiation oncology, SOFTWARE. radiology, nuclear medicine,

urology, neuroimaging, and cardiac imaging. MIM offers solutions for computer workstations, as well as mobile and cloud-based platforms. MIM products are sold globally to imaging centers, hospitals, specialty clinics, research organizations, and pharmaceutical companies.

Mobius Medical Systems | Booth # 1323

Mobius Medical Systems provides the radiation oncology community with

innovative software to streamline quality assurance. Mobius3D and MobiusFX are the first solutions for full 3D verification of both patient plan and delivery. Reclaim your nights and weekends! MobiusFX provides comprehensive patient specific QA in as little as one minute.

Modus Medical Devices Inc. | Booth # 1309

For 15 years, QUASAR™ has inspired physicists worldwide to seek the highest quality assurance

standards in the field of medical imaging and radiotherapy. With 3,000 phantoms in over 1,800 treatment centres, Modus products are built to provide you with confidence that every patient is receiving the best possible treatment.

NELCO | Booth # 1205

NELCO is the worldwide leader in the design, manufacturing and construction of radiation shielding products and

facilities for radiation therapy and diagnostic imaging. NELCO's 80 year dedication to customer service, quality, and innovative products has resulted in over 4000 radiation therapy doors installed worldwide and over 5000 customers.

Olympus Canada Inc. | Booth # 2112

Olympus develops leading edge technology for healthcare

professionals that help improve outcomes and enhance quality of life for patients. Visit us at Booth #2112 in the exhibit hall or on-line at www.olympuscanada.com

Oncology Systems Limited Inc. | Booth # 1230

ImSimQA software is a complete toolkit for performing QA on Deformable Image Registration algorithms. OnQ RTS is an automated clinical

system for performing Adaptive Planning functions including Deformable Image Registration. Add function without adding process to your department. Canadian distributors of MacroMedics immobilization and patient positioning devices.

Orfit Industries America | Booth # 1211

EXHIBITOR BIOGRAPHIES

Orfit supplies High Precision Immobilization Systems including Adult /Pediatric Head/Neck systems using Frameless full and

open face masks. MammoRx Breast Boards, SBRT Systems, Prone Breast Solutions, Extremities, Pelvis/Abdomen, Proton and MR Compatible systems are available.

Precision, reproducibility, ease of use, high patient comfort are hallmarks of the systems

Pacific Medical LLC | Booth # 2106

Pacific Medical LLC specializes with providing PARTS and **REPAIR SERVICES** for

Patient Monitors, Modules, Telemetry, Infusion Pumps, Suction Regulators, Fetal Transducers, SpO2/ECG/TEMP/ NIBP Cables, O2 Blenders, Endoscopes and Gas Analyzers. Pacific Medical carries the largest patient monitoring inventory in our industry and is recognized for its customer service response team.

For more information visit: www.pacificmedicalsupply.com.

PartsSource | Booth # 2209

PARTS **SOURCE**[®] PartsSource is a leading provider of

supply chain solutions for medical replacement parts for providers, Independent Services Organizations and OEMs in the healthcare industry who need to innovate their procurement process to reduce their overall sourcing costs.

Phillips Healthcare | Booth # 1201

Philips is dedicated to creating the future of healthcare and saving lives. We develop innova-

tive solutions across the continuum of care in partnership with clinicians and our customers to improve patient outcomes, provide better value, and expand access to care. www.philips.com

Physio-Control | Booth # 2306

LIFEPAK® defibrillator/monitors and automated external defibrillators from Physio-Control set the standard for quality and reliability and are used by more physicians, hospitals and emergency medical services than any other brand.

Physio-Control continues to lead the industry through innovation and advanced technology. For more information, visit our website at www.physio-control.com.

Precision X-Ray | Booth # 1210

Precision X-Ray is the leading provider of safe, high output X-Ray

irradiators used in modern translational cancer research. It's our mission to continually develop X-ray systems that help researchers globally to better understand radiation induced effects in the sciences of molecular biology and cancer research.

PTW | Booth # 1220

Since 1922 PTW has been a dosimetry pioneer, growing into a global market leader for high-tech dosimetry solutions, well-known for their product

Knowing what responsibility means

excellence and innovative strength. Today, PTW dosimetry products are the first choice by healthcare professionals in radiotherapy, diagnostic radiology, nuclear medicine and health physics. For more information, visit www.ptwny.com.

Qfix | Booth # 1327

Qfix provides state-of-the-art patient positioning and immobilization devices to optimize patient outcomes.

The Qfix kVue™ IGRT Couch Top design allows customization for individual patient needs through the most advanced array of treatment solutions for head and neck, breast, lung, prostate and other disease sites. Please visit www.Qfix.com for more information.

Radcal Corporation | Booth # 3204

Radcal is synonymous with quality non-invasive diagnostic x-ray meters and ion cham-

bers. The Accu-Gold Family of meters utilizes Radcal ion chambers and solid-state Multisensors for all your parameter measurements in all modalities. The newest addition to the Family is the Accu-Dose+ and WiFi data transmission.

Providing Better Solutions for You. www.Radcal.com

Radiological Imaging Technology Inc. | Booth # 1213

RIT manufacturers RIT113 Radiation Therapy Dosimetry software, and RADIA software for automated QC phantom analysis. RIT software

packages are designed to enable QA on all aspects of modern radiation therapy and diagnostic imaging, including TG-142 for linear accelerators, TG-148 for helical tomotherapy, and ACR CT and MRI testing.

Raysearch Laboratories | Booth # 1219

RaySearch is a medical technology company that develops advanced software solutions for improved

radiation therapy of cancer. RaySearch markets the RayStation® treatment planning system to clinics all over the world. In addition, RaySearch's products are distributed through licensing agreements with leading medical technology companies. RaySearch's software is used by over 2,500 clinics in more than 65 countries.

RTI (From Radiation to Information) | Booth # 1125

RTI provides complete quality assurance solutions for all X-ray modalities and facilities. We have "click &

go" solutions for X-ray quality assurance of X-ray modalities and facilities. Everything between basic service to specialists.

Our X-ray multimeter scan "do it all in one shot" – kV, time, dose, dose rate, HVL, pulsed fluoroscopy and total filtration.

Shimifrez | Booth # 2214

Shimifrez is the world's most trusted name in micro, thin metal

manufacturing, utilizing precision photo chemical machining (PCM). PCM produces highly accurate and identical thin metal components for small & large batches. PCM eliminates the cost of hard tooling, improves design flexibility and shortens lead times (72 hours) while eliminating burring and stress problems.

Southwest Medical Resources | Booth # 2210

Southwest Medical Resources is a world class independent service organization offering complete sales, service and

rental solutions for Diagnostic Imaging Equipment. Our leadership in the industry is driven by a team of experts and unmatched resources. We exist to bring quality and value to our customers.

Spacelabs Healthcare | Booth # 2114

Spacelabs Healthcare's philosophy is to develop innovative medical devices to

provide the best care experience for not only the patient and the clinician, but also the patients' families. Providing devices that help reduce stress can help enhance the experience for both patient and visitor alike.

Spectrum Technologies, Inc. | Booth # 2412

Spectrum Technologies, Inc. provides test instrument calibration and repair for the biomedical, commercial, and industrial markets. On-site services are

available regionally and depot services are available worldwide. Our main office is in Pennsylvania with branch offices strategically located across the USA and two in Canada. Our website: www.goSTI.cc Email: info@goSTI.cc

Springer | Booth # 2311

Looking to publish your research? Discover Springer's print and electronic publication

services, including Open Access! Get high-quality review, maximum readership and rapid distribution. Visit our booth or springer.com/authors. You can also browse key titles in your field and buy (e)books at discount prices. With Springer you are in good company.

Standard Imaging | Booth # 1110

Dedication to customer service, forging partnerships

and fostering innovation helps Standard Imaging pave an intuitive path to superior QA. Beginning with the HDR 1000 Well Chamber to the W1 Scintillator and PIPSpro Software today, Standard Imaging provides its customers with practical, precise products for their QA needs.

Sun Nuclear Corporation (SNC) | Booth # 1329

Sun Nuclear Corporation (SNC) is the worldwide market share

leader in QA and Dosimetry solutions for Radiation Oncology. While others speak of innovation, we live it. Our mission is to provide you with better outcomes that save time. SNC supports FFF Beams, VMAT, IMRT, SRS, TomoTherapy, CyberKnife, and Conventional external beam treatments.

Synaptive Medical | Booth # 3404

Synaptive Medical has engineers and scientists

specifically to the development of neurosurgical technologies. The result? Our BrightMatter™ Neurosurgery Products provide advanced tools and information for surgeons and hospitals to focus on patient outcomes.

Technical Prospects | Booth # 2102

TECHNICAL 🔠 PROSPECTS EXPERTS IN SIEMENS MEDICAL IMAGING

Technical Prospects has been in business

over 18 years, providing quality Siemens parts and service to nearly 500 customers worldwide. As a well-known medical imaging parts reseller, our main objective is to provide quality parts and service, technical support, maintenance services and training to medical facilities and health care providers.

The Phantom Lab/Image Owl | Booth # 1209

The Phantom Laboratory (www.phantomlab.com) manufactures medical imaging and radiation therapy phantoms. In addition to our standard

products we offer custom and OEM phantoms. We also work with Image Owl (www.imageowl.com) to provide fully automated, cloud-based, CT, MR and DBT image quality measurement and database services.

Tropical Health & Education Trust (THET) | Booth # 2511

THET is a specialist global health organisation that educates, trains and supports health workers through partnerships; enabling people

in low and middle-income countries to access essential healthcare. THET helped develop the first Biomedical Engineering training course in Zambia and are working with Government to improve medical equipment management and maintenance.

University of Waterloo, Engineering | Booth # 2414

Waterloo Engineering is home to 60+ researchers focused in biomedical engineering and biotech-

nology, who produce advancements in pharmaceutical delivery systems, affordable imaging systems, software solutions for healthcare and more. With strong partnerships in industry, healthcare and government, our researchers create next-generation technology to tackle the world's toughest biomedical problems.

USOC Medical | Booth # 2201

USOC Medical provides biomedical equipment repair solutions to healthcare

facilities, clinics and medical companies of all types and sizes. We are committed to providing high-quality, cost-effective equipment and services to all of our clients. Each member of our organization is dedicated to excellence and continual organization and professional improvement.

Varian Medical Systems | Booth # 1234

Varian Medical Systems is a leading manufacturer of medical devices for treating cancer and other conditions

with radiotherapy, radiosurgery, proton therapy, and brachytherapy. The company also produces informatics software for managing comprehensive cancer clinics. Varian is a premier supplier of tubes, digital detectors, and image processing workstations for X-ray imaging. www.varian.com

Western Medical Biophysics and BME | Booth # 3507

hospitals, we offer unique training opportunities in biomedical imaging, cardiovascular studies (microcirculation & hemodynamics), biomechanics, and cancer diagnosis & therapy, using a wide range of experimental and computational techniques.

World Congress 2018, Prague | Booth # 3311

The IUPESM World Congress 2018 will be held in Prague, Czech Republic on June 3 - 8, 2018. For constant updates please visit www.iupesm2018.org.

We invite you to visit our booth No. 3311 to try to win a FREE REGISTRATION for IUPESM 2018.

World Congress 2021, Candidate City - Mexico City | Booth # 3307

The Mexican Society of **Biomedical Engineering** (SOMIB) serves as the lead society and professional home for biomedical engineering. Our main mission is to

promote and enhance knowledge and education in biomedical engineering nationalwide and its utilization for human health and well-being. www.somib.org.mx

World Congress 2021, Candidate City - Singapore | Booth # 3614

Choose Singapore for 2021 World Congress - Singapore is excited to put forth a bid to host the IUPESM World Congress in 2021, the first

time it will be held in South East Asia. We are ready to welcome the global community of medical physicists and biomedical engineers to our multi-cultural city.

World Congress 2021, Candidate City - Taipei | Booth # 3212

The IUPESM 2021 World Congress (WC-2021) has proposed to be hosted in Taipei, an international city with convenient and wellequipped facilities, by the Chinese Society of Medical Physics, Taipei and Taiwanese Society of Biomedical Engineering together. Many

supports from local hospitals and related industrial companies will be offered for this important meeting. We believe that Taipei will be the optimum choice for this worldwide event in 2021.

World Health Organization | Booth # 3313

The World Health Organi-World Health zation is a U.N. specialized agency with a mandate as the directing and coordi-

nating authority of international public health work. Through its 6 regional offices, 147 country offices, 8000+ staff, and collaborators the WHO strives towards: "Attainment by all peoples of the highest possible level of health." The World Health Organization is a U.N. specialized agency with a mandate as the directing and coordinating authority of international public health work. Through its 6 regional offices, 147 country offices, 8000+ staff, and collaborators the WHO strives towards: "Attainment by all peoples of the highest possible level of health."

Xoft, a subsidiary of iCAD, Inc. | Booth # 1129

iCAD delivers innovative cancer detection and radiation therapy solutions and services that enable clinicians to find and treat cancers earlier and while enhancing patient

care. iCAD's Xoft® Axxent® Electronic Brachytherapy (eBx®) System[®] delivers high dose rate, low energy radiation, which targets cancer while minimizing exposure to surrounding healthy tissue. For more information, visit www.icadmed.com.

Zimmer Canada | Booth # 2303

Founded in 1927 and headquartered in Indiana, Zimmer designs, develops, manufactures and markets

orthopaedic reconstructive, spinal, trauma and dental implants, plus related surgical products. Zimmer has operations in more than 25 countries and sells products in more than 100 countries. The Company is supported by more than 8,500 employees worldwide.

CONNECTED CARE Because the future is collaborative

Visit Elekta at the World Congress of Medical Physics and Biomedical Engineering 2015 in Toronto Canada and discover how we are bringing information-guided cancer[™] care to you.

Stop by our **booth # 1202** to learn more about the latest innovations in:

- Monaco[®] Complete treatment planning system
- MOSAIQ[®] Oncology information system
- AQUA Machine quality management
- Oncentra[®] brachy planning (v4.5) Comprehensive treatment planning for brachytherapy
- Flexitron[®] treatment delivery Afterloading platform

Also, please join us for lunch where Stanley Benedict of University California Davis will discuss:

"New Technology Developments to Improve Patient Safety in Radiation Therapy".

Learn how a better focus on safety in technology can deliver better precision, better reliability and better outcomes. This is an important guidance for Elekta and consistent with the stated goals of ASTRO, ACR and more.

Presenter:

Stanley H. Benedict, Ph.D., DABR, FAAPM Professor & Vice Chair of Clinical Physics Department of Radiation Oncology University of California at Davis Comprehensive Cancer Center

June 9th, 2015 12:15 - 1:15 pm EST Metro Toronto Convention Center Room 718A

Please register at: http://www.elekta.com/wc2015symposium

INDUSTRY SUPPORTED SYMPOSIA

Monday, June 8, 2015 | 12:15 - 13:15

▶ Room 718A

SYMPOSIUM SUPPORTED BY

Advancing Radiation Therapy through Software Innovation

Delegates are welcome to attend RaySearch's Lunch Symposium. It will show how software will be the driving force of innovation in radiation therapy and notably in adaptive therapy.

Wednesday, June 10, 2015 | 12:15 - 13:15

► Room 716B

SYMPOSIUM SUPPORTED BY

Improving Medication Safety through Infusion Pump Auto-Programming and EMR System Interoperability

Interoperability between infusion systems and a hospital EMR presents new opportunities for improving IV infusion safety, patient care and clinical workflow. At this event, attendees will have the opportunity to learn about experiences with system integration and the benefits it brings to patients, clinicians, IT, BioMed and Informatics.

Tuesday, June 9, 2015 | 12:15 - 13:15

► Room 718A

SYMPOSIUM SUPPORTED BY

New Technology Developments to Improve Patient Safety in Radiation Therapy

Learn how a better focus on safety in technology can deliver better precision, better reliability and better outcomes. This is an important guidance for Elekta and consistent with the stated goals of ASTRO, ACR and more.

Thursday, June 11, 2015 | 12:15 - 13:15

Room 714B

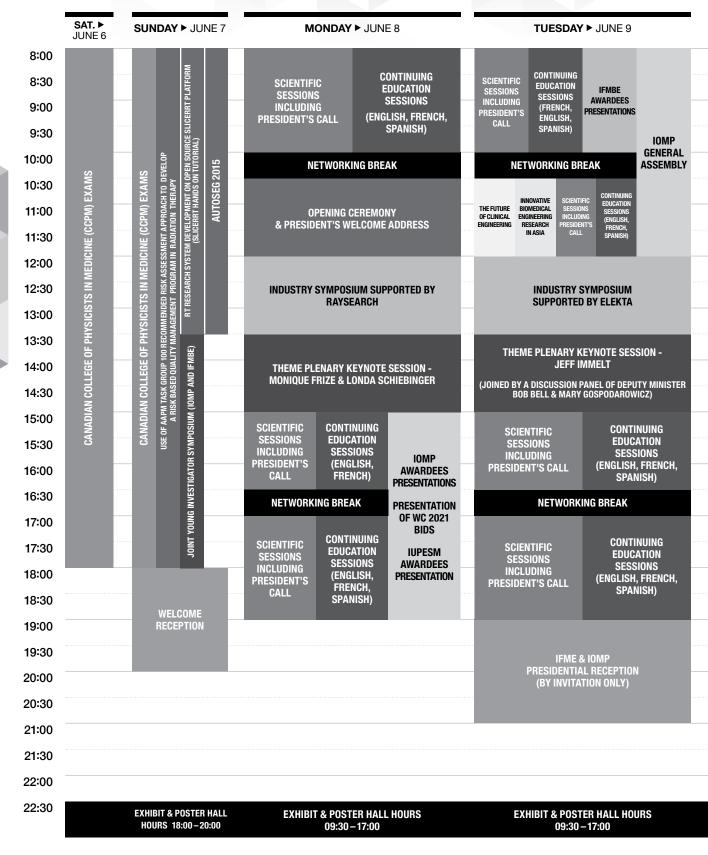

SYMPOSIUM SUPPORTED BY

Accuray's Innovative Radiation Therapy and Clinical Benefits

Through close collaboration with our customers, we have developed premier oncology tools that meet the needs of clinicians and the demands of any oncology department. Our portfolio of products allows clinicians to treat tumors of all sizes, regardless of their location in the body. Please join us to learn more about Accuray's offerings in the radiation therapy field.

PLENARY SESSIONS

PLENARY SESSIONS

Monday, June 8 2015

SESSION DATE:	MONDAY, JUNE 8 2015
SESSION TIME:	13:30 - 15:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	PL01 - WOMEN IN BIOMEDICAL ENGINEERING AND MEDICAL PHYSICS
SPEAKER(S):	MONIQUE FRIZE & LONDA SCHIEBINGER

PL01.1 Engaging Women and Men for a Better Future Worldwide

Speaker(s): Monique Frize

Systems and Computer Engineering, Carleton University, Ottawa/ON/CANADA

From the three approaches suggested by Londa Schiebinger to harness the power of gender analysis, this part of the presentation deals with the first two: "Fixing the number of women" and "fixing the institutions". Women and men can generate and participate in activities that lead to an increased participation of women in biomedical engineering and

medical physics. Evidence also exists, demonstrating that there are economic benefits and more complete solutions created by gender balanced design teams and an increased number of women in decision-making bodies such as corporate boards, management teams in industry, government, and universities. It is critical to collect sex disaggregated data on undergraduate post-secondary enrolments and graduations in science and engineering, as well as to understand the gender participation in the workplace in these fields. Examining the issues that limit women's participation at all levels is a first step, which can then be followed by the development and implementation of strategies that help eliminate gender bias and provide the necessary support for women to have a successful career in these fields.

PL01.2 Gendered Innovations in Health & Technology

Speaker(s): Londa Schiebinger

Stanford University, Stanford, United States of America

How can we harness the power of gender analysis to discover new things? Schiebinger identified three major approaches to gender in science research, policy, and practice: 1) "Fix the Numbers of Women" focuses on increasing women's participation; 2) "Fix the Institutions" promotes gender equality in careers through structural change in research

organizations; and 3) "Fix the Knowledge" or "gendered innovations" stimulates excellence in science and technology by integrating sex and gender analysis into research. This talk focuses on the third approach. Gendered Innovations: 1) develops state-of-the-art methods of sex and gender analysis for scientists and engineers; and 2) provides 24 case studies as concrete illustrations of how sex and gender analysis leads to new ideas and excellence in research. Several case studies will be discussed, including stem cells, assistive technologies for the elderly, and osteoporosis in men. All case studies can be found at: http://genderedinnovations.stanford.edu/. To match the global reach of science and technology, this project was developed through a collaboration of over sixty experts from across the United States, Europe, and Canada (and has now extended to Asia). Gendered Innovations was funded by the National Science Foundation, the European Commission, and Stanford University.

Tuesday, June 9 2015

SESSION DATE:	TUESDAY, JUNE 9 2015
SESSION TIME:	13:30 - 14:30
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	PL02 - NEXT GENERATION MEDICINE
SPEAKER(S):	JEFF IMMELT

PL02.1 Innovation, Healthcare and the Future

Speaker(s): Jeff Immelt

Chairman and CEO of GE, Fairfield/CT/UNITED STATES OF AMERICA

Jeff Immelt, Chairman & CEO of GE, will talk about healthcare innovation and how GE has been repositioning its business to succeed in a market that is demanding more technology, more flexibility and more tailored solutions.

Wednesday, June 10 2015

SESSION DATE:	WEDNESDAY, JUNE 10 2015
SESSION TIME:	8:00 - 10:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	PLO3 - URBAN HEALTH AND FUTURE EARTH / GLOBAL HEALTH CHALLENGES
SPEAKER(S):	GORDON MCBEAN & MARY GOSPODAROWICZ

PL03.1 The Changing Urban Environment and Health in a Future Earth

Speaker(s): Gordon Mcbean

Western University, London/ON/CANADA

Around our planet there have been increasing numbers of disasters due to floods, storms, earthquakes and other natural hazards. Although earthquakes are most horrific when they happen, climate-related events cause about three-quarters of all disasters and as the climate warms, these hazards are increasing. There is also the migration to people to major

cities, often on coasts of the oceans or major rivers. The result is the intersection of the effects of the major issues of climate change, disaster risk reduction and sustainable development. In all cases we need to look to the future and takes actions now to reduce losses in the future.

In 2015, nations will negotiate a revised framework on action on disaster risk reduction, a possible Paris-protocol on climate change and Sustainable Development Goals to be attained by all countries by 2030. The draft list of SDGs includes: end poverty and hunger; attain healthy life for all at all ages; secure water and sanitation; and build inclusive, safe and sustainable cities and human settlements. For the global science community, the challenge is providing the scientific basis for definitions and approaches, including how to achieve these goals and the criteria for measurement of progress.

This presentation will bring together these issues in the context of the new international research programs Future Earth: Research for Global Sustainability; Integrated Research on Disaster Risk; and Health and Wellbeing in the Changing Urban Environment: a Systems Analysis Approach; with a Canadianfunded project, Coastal Cities at Risk: Building Adaptive Capacity for Managing Climate Change in Coastal Megacities. The Future Earth program is adopting an approach to involve the stakeholder community in the research program from the beginning to co-design and co-produce the research based on the logic that this will make the research most directly relevant to societies needs to address these issues. The Coastal Cities research project is integrating across social-natural-economicengineering and health sciences to develop a systems approach to quantifying urban resilience and then undertake "what if" experiments to identify the most effective approaches to improving resilience and reducing impacts, recognizing the complex interactions across these elements of society.

The International Council for Science is leading the Science and Technology Major Groups to input to these UN processes and will endeavour to bring these scientific principles to the negotiations. Working with UN agencies such as UNESCO, UNU and WMO, and non-governmental partners such as the Inter-Academy Medical Panel, the Council will continue in the coming decades to assert the importance of scientific bases for these international agreements and national actions. We need to have the full support of medical physicists and biomedical engineers engaged in supporting health care in diverse environments in order to achieve these societal objectives, consistent with the Council's Mission to strengthen international science for the benefit of society - all societies and all people.

PL03.2 Cancer: The Global Health Challenge

Speaker(s): Mary Gospodarowicz

Professor of Radiation Oncology, University of Toronto, Canada. Medical Director, Princess Margaret Cancer Centre, and Regional Vice President, Cancer Care Ontario

Thursday, June 11 2015

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	13:30 - 15:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	PL04 - EVIDENCE AND HEALTH INFORMATICS
SPEAKER(S):	EDWARD SHORTLIFFE & VIMLA PATEL

PL04.1 Academic Biomedical Informatics: Synergies and Challenges at the Interface with Industry

Speaker(s): Edward Shortliffe

College of Health Solutions, Arizona State University, Phoenix/ UNITED STATES OF AMERICA

Academic biomedical informatics has achieved great successes through research contributions and education of professional informaticians over several decades, now reflected in a thriving commercial marketplace for electronic health records and other informatics tools. That very success, coupled with changes in the ability of governments to support research at past levels,

is forcing a reconsideration of the directions and emphases for faculty members in informatics academic units. In this presentation Dr. Shortliffe will discuss those forces and propose areas of emphasis that will strengthen the academic discipline as it continues to evolve. He will distinguish the roles of academic informaticians as practitioners of informatics, as researchers, and as educators. He will also stress the necessary synergies between academic informatics and the health information technology industry, arguing that both will be strengthened by more fertile relationships and joint efforts.

PLENARY SESSIONS

PL04.2 Cognitive Challenges for Safe Human Computer Interaction

Speaker(s): Vimla Patel

The New York Academy of Medicine and Columbia University, New York/UNITED STATES OF AMERICA

Given the complexities of modern medicine, delivery of safe and timely care is an ongoing and recognized challenge. Errors, misunderstandings, and inaccuracies—large and small—are routine occurrences in healthcare delivery. Health information technology (IT) has undoubtedly reduced the risk of serious injury for patients. However, its true potential for

preventing medical errors remains only partially realized. Unfortunately, such systems may even give rise to hazards of their own. There is a growing recognition that many errors are attributable neither solely to lapses in human performance nor to flawed technology. Rather they develop as a product of the interaction between human beings and technology. In our view, errors are the product of cognitive activity in human adaptation to complex physical, social, and cultural environments. How well the design of health IT complements its intended setting and purpose is critically important for safe and effective performance. In this presentation, I will discuss the cognitive challenges we face in understanding human-computer interaction (HCI) that make the integration of computing and clinical practice a difficult task that, improperly addressed, can lead to threats to patient safety.

SHARPEN YOUR EDGE AGAINST CANCER.

Edge Radiosurgery: Making radiosurgery an option for more patients.

Deliver accurate radiosurgery treatments quickly and efficiently with the Edge[™] radiosurgery system. Edge's advanced technology enables you to offer powerful, non-invasive radiosurgery treatments anywhere in the body where radiation is indicated. Expand treatment options for patients and gain a competitive edge with the system as dedicated as you are.

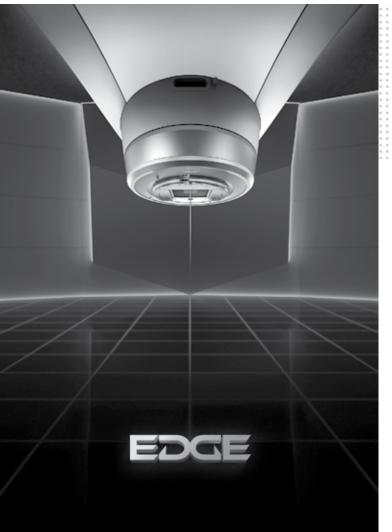

Visit us at IUPESM World Congress 2015. Booth #1234. Learn more about Edge Radiosurgery at varian.com/Edge

A partner for life

Radiation treatments may cause side effects that can vary depending on the part of the body being treated. The most frequent ones are typically temporary and may include, but are not limited to, irritation to the respiratory, digestive, urinary or reproductive systems, fatigue, nausea, skin irritation, and hair loss. In some patients, they can be severe. Radiation treatment is not appropriate for all cancers. See varian.com/use-and-safety for more information.

SPECIAL SESSIONS

SPECIAL SESSIONS

Sunday, June 7 2015

SESSION DATE:	SUNDAY, JUNE 7 2015
SESSION TIME:	08:00 - 17:15
SESSION ROOM:	716
SESSION TITLE:	SS01 - USE OF AAPM TASK GROUP 100 RECOMMENDED RISK ASSESSMENT APPROACH TO DEVELOP A RISK BASED QUALITY MANAGEMENT PROGRAM IN RADIATION THERAPY

SESSION ORGANIZER(S): SAIFUL HUQ

AGENDA:	
TG-100 overview and introduction	Saiful Huq
Safety Guidance for Radiotherapy	Peter Dunscombe
Incident learning systems: Structure, terminology and taxonomies	Peter Dunscombe
Exercise 1: Event Classification	
Process mapping	Saiful Huq
Exercise 2: Process Mapping	
Systems and Culture	Jean-Pierre Bissonnette
LUNCH	
Fault Trees	Peter Dusncombe
Exercise 3: Fault Tree Analysis	
Design of QM from the Risk Assessment	Ellen Yorke
Exercise 4: QM Layout	
Change Management	Jean-Pierre Bissonnette
Wrap and final questions	Saiful Huq

SESSION DATE:	SUNDAY, JUNE 7 2015			
SESSION TIME:	08:00 - 13:30			
SESSION ROOM:	715B			
SESSION TITLE:	SS02 - AUTOSEG 2015			
SESSION ORGANIZER(S): STEPHEN BREEN & VLADIMIR PEKAR				

Introduction to Session:

This program will focus on automated methods for medical image segmentation. Topics will include: clinical applications, algorithms, and computational implementation.

Medical physicists, biomedical engineers, imaging scientists, computer scientists and healthcare professionals who use autosegmentation methods will enhance their knowledge and skills by attending this one-day event.

Ten leaders in autosegmentation will be presenting their latest methods and results.

After this event, attendees will be able to describe several autosegmentation algorithms; compare and evaluate different autosegmentation techniques; and select amongst different algorithms for varied imaging modalities and tasks.

SESSION DATE:	SUNDAY, JUNE 7 2015			
SESSION TIME:	08:00 - 13:30			
SESSION ROOM:	715A			
SESSION TITLE:	SS03 - RT RESEARCH SYSTEM DEVELOPMENT ON OPEN-SOURCE SLICERRT PLATFORM			
SESSION ORGANIZER(S): GABOR FICHTINGER AND CSABA PINTER				

SESSION DATE:	SUNDAY, JUNE 7 2015
SESSION TIME:	13:30 - 18:00
SESSION ROOM:	718A
SESSION TITLE:	SSO4 - YIS PRESENTATIONS – JOINT IOMP & IFMBE

MON./TUES. JUNE 8/9 2015

SPECIAL SESSIONS

Monday, June 8 2015

SESSION DATE:	MONDAY, JUNE 8 2015
SESSION TIME:	15:00 - 16:30
SESSION ROOM:	714B
SESSION TITLE:	SS05 - EUROPEAN INITIATIVES IN MEDICAI Radiation protection

SESSION ORGANIZER(S): EUGENE LIEF AND JOHN DAMILAKIS

AGENDA:

PiDRL: A European Commission project on Paediatrc DRLs	Professor John Damilakis, EFOMP President.
Overview of EFOMP projects on Radiation Protection	Professor Virginia Tsapaki, EFOMP
Collaboration of AAPM and EFOMP on Radiation Protection Projects	Dr. Eugene Lief, AAPM
Question and Answer time	

Tuesday, June 9 2015

SESSION DATE:	TUESDAY, JUNE 9 2015
SESSION TIME:	08:00 - 10:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	SS10 - IFMBE AWARDEES PRESENTATIONS

The Awardees will include:

- ▶ IFMBE Laura M.C. Bassi Award: Alison Noble
- ▶ IFMBE Otto Schmidt Award: Karin Wardell
- ▶ IFMBE Vladimir Zworykin Award: Chwee Teck Lim
- IFMBE John A. Hopps Distinguished Service Award: Robert M. Nerem

SESSION DATE:	TUESDAY, JUNE 9 2015	
SESSION TIME:	10:30 - 12:00	
SESSION ROOM:	713A	
SESSION TITLE:	SS08 - THE FUTURE OF CLINICAL ENGINEERING EDUCATION	

TUESDAY, JUNE 9 2015

SESSION ORGANIZER(S): TOH SIEW-LOK AND JAMES GOH

SS09 - INNOVATIVE BIOMEDICAL ENGINEERING RESEARCH IN ASIA

10:30 - 12:00

714B

SESSION ORGANIZER(S): HERBERT F. VOIG

SESSION DATE:

SESSION TIME:

SESSION ROOM:

SESSION TITLE:

SESSION DATE:	MONDAY, JUNE 8 2015
SESSION TIME:	15:00 - 16:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	SS06 - IOMP AWARDEES PRESENTATIONS

The Awardees will include:

- Marie Sklodowska-Curie Award: Colin Orton
- ► Harold Johns Medal: William Hendee

SESSION DATE:	MONDAY, JUNE 8 2015
SESSION TIME:	16:00 - 18:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	SS07.1 - PRESENTATION OF 2021 BIDS

SESSION DATE:	MONDAY, JUNE 8 2015
SESSION TIME:	18:00 - 19:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	SS07.2 - IUPESM AWARDEES PRESENTATIONS

The Awardees will include:

- ▶ IUPESM Award of Merit IFMBE recipient: Fumihiko Kajiya
- ▶ IUPESM Award of Mertit Medical Physics: Peter Smith

Wednesday, June 10 2015

SESSION DATE:	WEDNESDAY, JUNE 10 2015	
SESSION TIME:	10:30 - 12:00	
SESSION ROOM:	714A	
SESSION TITLE:	SS11 - ICSU BIO-UNIONS CLUSTER SESSION	
SESSION ORGANIZER(S): HERBERT F. VOIGT		

SESSION DATE:	WEDNESDAY, JUNE 10 2015	
SESSION TIME:	10:30 - 12:00	
SESSION ROOM:	713A	
SESSION TITLE:	SS12 - WORLD SUMMIT ON THE SUPPORTABILITY OF MEDICAL DEVICES	
SESSION ORGANIZER(S): MIKE CAPUANO AND JEAN NGOIE		

Introduction to Session:

For years, in-house clinical engineering (CE) departments and independent service organizations have faced several challenges. These relate to obtaining the supports required to service and maintain medical equipment in the field. To the CE community, providing safe, cost-effective, and expedient service depends on ability to obtain spare parts, service manuals, technical training, software, and access pass codes. It is becoming increasingly difficult to obtain these items. Manufactures are placing conditions on servicing their products. Either no supports are provided or they charge very high prices to acquire them. Some companies will not allow servicing in the field unless expensive training is acquired. They create proprietary manuals and information separately for OEM eyes only and may charge even more to acquire this. Manufacturers contribute to the issue citing risks to the reliable support of their product. Purchasing agents are easily swayed by vendor claims of complexity that they and only they can service it (not field serviceable) and various other unfounded risks like 'FDA won't allow it.' Manufacturers and CE need to develop an understanding and common ground that will serve both sides so only the patient benefits.

Objectives

To discuss with Biomedical and Clinical Engineers, Physicists, Scientists, Academics, Healthcare Technology Managers, Healthcare Institutions, Manufacturers, Vendors, Independent Service, Organizations, Regulatory Agencies, Independent Research Organizations the issue of serviceability of Medical Devices.

The summit focus will be on questions below:

- 1. Is there a problem?
- 2. If so, how do we articulate it?
- 3. Define 'Supportability'
- 4. Provide perspective from both sides

- 5. Listen to comments, questions, and answers
- 6. List proposals, measures, and recommendations
- 7. Summarize
- 8. Publish summit outcome

Impact on the Medical Device Industry

Medical equipment manufacturers may find a competitive edge when they fully support service of equipment in the field. When customers compare a vendor's product, field supportability can be grounds for decision-making. Today's devices and systems are becoming more and more similar from both hardware and software perspectives. The level of distinction among competing products and vendors is shrinking. Correspondingly, characteristics around the purchasing aspect have become increasingly apparent. From an in-house clinical engineering perspective, the vendor's support for field supportability could make acquisition more efficient for in-house CE departments (less haggling). In-house service is known to reduce equipment cost of ownership in hospitals. This apply to all patient related technologies.

Supportability Defined

The level of ease to which a specific medical device or system is serviced by entities other than representatives or direct agents of the original equipment manufacturer (OEM).

SESSION DATE:	WEDNESDAY, JUNE 10 2015	
SESSION TIME:	12:00 - 13:30	
SESSION ROOM:	713A	
SESSION TITLE: SS13 - HTA OF MEDICAL DEVICES: PREMARK Challenges (roundtable on health Technology assessment)		
SESSION ODCANIZED(S): NICOLAS DALLIKARAKIS		

SESSION ORGANIZER(S): NICOLAS PALLIKARAKIS AND LEANDRO PECCHIA

AGENDA:	
Regulation of MDs, the EU prospective	Nicolas PalliKarakis, University of Patras, Greece, and Chair HTA Division of IFMBE
Pre-market HTA of Medical Devices: an overview	Leandro Pecchia, University of Warwick, UK, and Treasurer of HTA Division of the IFMBE
From Monitoring the European Innovation Partnership on Active and Healthy Ageing (EIP on AHA) to early technology assessment	Christian Boehler. Joint Research Centre, European Commission, Seville, Spain
Multi-criteria decision analysis as a tool for medical devices assessment: a case study on R&D portfolio decision for new robotics in healthcare	Marjan Hummel, University of Twenty, The Nederlands

SESSION DATE:	WEDNESDAY, JUNE 10 2015
SESSION TIME:	13:30 - 16:30
SESSION ROOM:	714
SESSION TITLE:	SS14 - MEDICAL PHYSICS & BIOMEDICAL ENGINEERING RESPONSE TO CANCER CONTROL: A GLOBAL HEALTH CHALLENGE (A SYMPOSIUM SPONSORED BY IUPESM-HTTG & UICC-GTFRCC)

SESSION ORGANIZER(S): JAKE VAN DYK AND CARI BORRAS

AGENDA:		
13:30-13:35	Introduction	Cari Borrás, Chair, IUPESM- Health Technology Task Group (HTTG), Washington DC, United States
13:35-14:00	The Global Cancer Burden and WHO's Response	Adriana Velazquez, World Health Organization (WHO), Geneva, Switzerland
14:00-14:25	Biomedical Engineering Research for Cancer Diagnostics and Therapeutics	Ratko Magjarević, University of Zagreb, Zagreb, Croatia
14:25-14:50	Appropriate Technologies for Cancer Diagnostics and Therapeutics	Cari Borrás, HTTG, Washington DC, United States
14:50-15:15	IAEA Activities in Support of Radiation Therapy Services	Joanna Izewska, International Atomic Energy Agency (IAEA), Vienna, Austria
15:15-15:40	Initiatives of Expertise Mobilization	Jacob Van Dyk, Western University, London, Ontario, Canada
15:40-16:05	Equal Access to Radiation Therapy by 2035	David Jaffray, Global Task Force on Radiotherapy for Cancer Control (GTFRCC), Ontario Cancer Institute, Toronto, Canada
16:05-16:30	Discussion and Summary	Jacob Van Dyk, Western University, London, Ontario, Canada

SESSION DATE:	WEDNESDAY, JUNE 10 2015
SESSION TIME:	13:30 - 15:00
SESSION ROOM:	713A
SESSION TITLE:	SS15 - METHODS AND TOOLS FOR PRE- MARKET HTA OF MEDICAL DEVICES (HEALTH TECHNOLOGY ASSESSMENT FOR BIOMEDICAL ENGINEERS WORKSHOP)
SESSION ORGANIZ	FR(S): NICOLAS PALLIKARAKIS

AND LEANDRO PECCHIA

AGENDA:	
Multi-criteria decision analysis for medical devices assessment	Marjan Hummel, University of Twenty, the Nederland
A tool to monitor the European Innovation Partnership on Active and Healthy Ageing: development, implementation and potential use for pre-market HTA	Christian Boehler, Joint Research Centre, European Commission, Seville, Spain
AHP for user need elicitation: method and available tools	Leandro Pecchia, University of Warwick and Treasurer of HTA Division of the IFMBE

Thursday, June 11 2015

SESSION DATE:	THURSDAY, JUNE 11 2015	
SESSION TIME:	10:30 - 12:00	
SESSION ROOM:	713A	
SESSION TITLE:	SS16 - ADDRESSING GLOBAL CHALLENGE	
SESSION ORGANIZER(S): ROGER KAMM		

Introduction to Session:

This Special Session "Addressing Global Challenges" will be presented by the past and current Chairs of the International Academy of Medical and Biological Engineering of the IFMBE.

The Opening Presentation by Robert Nerem is on "Bioengineering in the 21st Century", followed by presentations on a variety of topics addressing global challenges from different perspectives including device technologies, information technologies, and innovative uses of physiological modeling.

AGENDA:	
Bioengineering in the 21st Century	Robert Nerem (Georgia Technological Institute, USA)
Contribution of medical and biological engineering to medical care in coming super-aging society -collaboration among academia, industry and government	Ueno Shoogo (Dept of Applied Quantum Physics, Graduate School of Engineering, Kyushu University, Japan) Fumihiko Kajiya (Kawasaki University of Medical Welfare and Kawasaki Medical School, Japan)
ICT for Prevention of Non-Communicable Diseases	Niilo Saranummi (VTT Technical Research Centre of Finland, Finland)
The Future Potential for Living, Multicellular Machines	Roger Kamm (Massachusetts Institute of Technology, USA)

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	12:00 - 13:30
SESSION ROOM:	715B
SESSION TITLE:	SS17 - SPREADING AND INTEGRATING HUMAN FACTORS EXPERTISE IN HEALTHCARE AN INTERNATIONAL PANEL DISCUSSION
SESSION ORGANIZ	ER(S): SONIA PINKNEY AND TONY EASTY

Introduction to Session:

S

Over the past decade, improving patient safety has been a priority for many healthcare organizations, but progress in the reduction of preventable patient harm has been slow. Human factors (HF) is recognized as an important scientific approach to improve health technology safety when applied to both premarket (e.g., improved technology design), and post-market (e.g., improved practices, training and technology configuration/ implementation) activities. HF is a discipline focused on improving safety by recognizing that humans are fallible, despite good intentions and hard work. It aims to build system resilience by focusing on the conditions under which people work and building defenses to minimize errors and their impacts.

While the potential for HF to improve healthcare safety is well established, it is not integrated and embedded in most safety initiatives. A possible explanation for this unfulfilled potential is that there are limited HF experts working in healthcare. Most HF-related work to date is done at a few organizations in a few countries (i.e., organizational silos). In addition, there has been a lack of formal professional collaboration between HF experts, patient safety leaders, regulators, clinicians, and health technology managers and designers, resulting in disparate expertise (i.e., professional/expertise silos). As such, there is a need to spread HF expertise internationally and across healthcare-related professions (e.g., clinical engineers, biomedical technicians, designers) so they can be empowered to take more active roles in initiating and leading safety projects that incorporate HF.

HumanEra, an HF team based at the University Health Network in Toronto, Canada, has been teaching HF to various healthcare sectors and stakeholders for almost 10 years. Teaching tactics have included:

- Introductory HF workshops
- ► HF method courses
- Partnering with healthcare organizations to build in-house HF teams/expertise (multi-year contracts focused on projectbased collaborations)
- An introductory HF book (expected publication late 2015)

This session will consist of a panel of HumanEra teachers and past international students to share our combined experiences in teaching, learning, and applying HF for the first time to a safety initiative. The panel will include representatives from different sectors (e.g., academics, clinical engineers, regulators, designers/vendors) and countries (e.g., Canada, Brazil, Spain).

SPECIAL SESSIONS

By attending this session you will:

- Discover how HF can improve healthcare safety
- Learn from the panel's experience about applying HF in their different roles/professions, organizations, and/or jurisdictions
- Contribute to meaningful discussions about how you can become an HF champion and help to accelerate the adoption of HF in your organization
- Meet international professionals interested in HF collaboration to contribute to the cross-fertilization of this important field

AGENDA:	
Overview:	A brief introduction to HF will be provided (e.g., define HF for the healthcare context)
Presentations:	Each panel member will present a short summary of their experience in promoting and applying HF to healthcare, focusing on their successes and barriers.
Interactive discussion:	The presentations will serve as a springboard for an interactive discussion between panel members and the audience.
	Moderated by Dr. Patricia Trbovich

AGENDA:	
Introductory Words from the President of IUPESM	Dr. Herbert F. Voigt (USA)
A Homage to Rene Favaloro's Life: Upgrading Biomedical Engineering Curricula Through Medical Humanism	Dr. Ricardo Armentano (Argentina)
Social Implications of Technology Reuse for a Sustainable Growth	Dr. Laura Roa (Spain)
Realizing and Preserving Privacy and Security for Self, in Interoperable Global Healthcare Venues	Dr. Robert Mathews (USA)
Ethical Issues in Public Health Epidemiology	Dr. Rajaram Lakshminarayan (USA)
A 2015 Moral and Ethical version of the Internet Neutrality Debate: The Digital Divide and Homecare Delivery for the less fortunate	Dr. Luis Kun (USA)

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	12:00 - 13:30
SESSION ROOM:	716B
SESSION TITLE:	SS20 - EMBEDDED SENSOR SYSTEMS FOR HEALTH WORKSHOP

SESSION ORGANIZER(S): MARIA LINDEN

AGENDA:		
12:00-12:05	Introduction	Maria Lindén, Mälardalen University
12:05-12:20	Embedded Sensor Systems with the Prospect of Monitoring, Promoting and Rehabilitating Health	Maria Lindén, Mälardalen University
12:20-12:35	A Four-Wheeled Rollator with Automated Walking Aid	Olof Lindahl, Umeå University Hospital
12:35-12:50	Towards Implementing More Intelligent Healthcare	Hamid GholamHosseini, Auckland University, New Zealand
12:50-13:05	Early Stroke Detection by Microwaves	Magnus Otterskog, Mälardalen University
13:05-13:20	Current Developments and the Future of ECG Devices	lvan Tomasic, Mälardalen University
13:20-13:30	Discussion	

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	12:00 - 13:30
SESSION ROOM:	713B
SESSION TITLE:	SS18 - MEDICAL PHYSICISTS WITHOUT BORDERS
SESSION ORGANIZ	ER(S): JAKE VAN DYK

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	12:00 - 13:30
SESSION ROOM:	717B
SESSION TITLE:	SS19 - SOCIAL IMPLICATIONS OF TECHNOLOGY Workshop (in honor or our friend & Colleague; dr lodewijk bos)
SESSION ORGANIZER(S): LUIS KUN	

SPECIAL SESSIONS

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	12:00 - 13:30
SESSION ROOM:	713A
SESSION TITLE:	SS25 - CHALLENGES AND BENEFITS OF CLINICAL ENGINEERING PEER REVIEW
SESSION ORGANIZ	FR(S): MICHAEL J. CAPUANO & JEAN NGOIE

SESSION DATE:	THURSDAY, JUNE 11 2015
SESSION TIME:	15:00 - 17:00
SESSION ROOM:	PLENARY HALL (HALLS F&G)
SESSION TITLE:	SS21 - LEADERS SUMMIT
SESSION ORGANIZI	ER(S): DR. HERB VOIGT, DR. TONY EASTY AND DR. DAVID JAFFRAY

Introduction to Session:

The World Biomedical Engineering and Medical Physics Leaders' Summit is the inaugural tri-annual high-level policy meeting dedicated exclusively to furthering the role of biomedical engineering and medical physics in medicine. This unique event brings together key decision makers, academics, and practicing engineers and physicists from around the globe and encourages timely debate on emerging issues related to the development and sustainability of the role and impact of medical physicists and biomedical engineers in medicine and healthcare. The Summit provides a unique and important forum to secure a coordinated, multileveled global response to the need, demand, and importance of creating and supporting strong academic and clinical teams of biomedical engineers and medical physicists for the benefit of human health.

Key Objectives of the Leaders' Summit:

- Raising awareness among leading decision makers to ensure the role of biomedical engineering and medical physics is recognized as a local, regional, and global health priority.
- Providing a forum to exchange information and innovative ideas on how to create and sustain academic and clinical programs in medical physics and biomedical engineering.
- Creating a force that galvanizes the leadership and decisionmakers in academia, industry, and medicine to assure the role of these two translational and impactful disciplines expand their impact on human health.
- Defining compelling messages to support the critical role that biomedical engineers and medical physics play in supporting and advancing human health.

THURSDAY, JUNE 11 2015

WORLD CONGRESS ON MEDICAL PHYSICS & BIOMEDICAL ENGINEERING

ADVANCING RADIATION THERAPY THROUGH SOFTWARE INNOVATION

Monday, June 8, 2015 At 12:15 to 13:15 Metro Toronto Convention Centre, South Building Room 718A Lunch will be provided

12:15 - 12:35

Considerations for implementing adaptive therapy using RayStation

Bon Mzenda, Chief Physicist Auckland Radiation Oncology, Auckland, New Zealand

12:35 - 12:55

Deformable Image Registration and Dose Accumulation

Jean-Pierre Bissonnette & Vicky Kong Radiation Medicine Program Princess Margaret Cancer Center, Toronto Canada

12:55 - 13:15

Advancing radiation therapy through software innovation

Johan Löf, CEO RaySearch Laboratories AB, Stockholm, Sweden

Moderator: Marc Mlyn, CEO, RaySearch Americas Inc.

ADVANCING CANCER TREATMENT

SCIENTIFIC PROGRAM

TRACK 01: IMAGING				
SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	08:00 - 09:30	718A	SP001	Image Processing and Visualization: Part 1
	15:00 - 16:00	718A	SP013	MRI: Methods
	17:00 - 18:00	718A	SP023	Quantitative Imaging: Part 1
	17:00 - 18:45	701A	SP024	Breast CAD and New Breast Imaging Techniques
TUESDAY, JUNE 9, 2015	08:00 - 10:00	718A	SP034	CT: New Techniques
	08:00 - 09:30	701B	SP035	Imaging Detector Technology
	10:30 – 12:00	701B	SP044	Bio-Impedance and Imaging (Other)
	17:00 - 18:45	718A	SP065	Conebeam CT
	17:00 - 18:45	701B	SP070	Molecular Imaging PET/SPECT: Part 2
WEDNESDAY, JUNE 10, 2015	13:30 - 14:45	718A	SP088	Computer Aided Diagnosis
	15:00 - 16:15	718A	SP096	Optical Imaging: Applications
	15:00 – 17:00	701B	SP097	Quantitative Imaging: Part 2
	17:00 - 18:00	701B	SP104	Phantoms
	17:00 – 19:00	718A	SP105	MRI: Novel Approaches and Molecular Imaging & Applications
THURSDAY, JUNE 11, 2015	10:30 - 11:45	718A	SP128	Multimodality Imaging
	08:00 - 10:00	718A	SP115	CT Image Quality and Dose Optimization
	08:00 - 10:00	701B	SP116	Image Processing and Visualization: Part 2
	10:30 - 12:00	701B	SP129	Image Quality Assessment (Mammography and Other)
	15:00 - 16:30	718A	SP139	Optical Imaging: Methods
	17:00 - 18:45	718A	SP149	Iterative Reconstruction
	17:00 - 18:45	701B	SP150	X-Ray Phase Contrast & Scatter Imaging
FRIDAY, JUNE 12, 2015	08:00 - 09:45	718A	SP161	Angiography / X-ray Imaging
	08:00 - 10:00	701B	SP162	Ultrasound and OCT: Applications
	10:30 - 12:00	718A	SP172	Mammography and Tomosynthesis
	10:30 - 11:45	701B	SP173	Ultrasound and OCT: Methods

TRACK 02: BIOMATERIALS AND REGENERATIVE MEDICINE							
SESSION DATE TIME		ROOM		SESSION TITLE			
MONDAY, JUNE 8, 2015	08:00 - 09:45	717B	SP002	Stem Cells in Tissue Engineering and Regeneration			
TUESDAY, JUNE 9, 2015	17:00 - 18:45	717B	SP071	Scaffolds in Tissue Engineering			
WEDNESDAY, JUNE 10, 2015	15:00 - 16:45	717B	SP098	Biomaterials and Regenerative Medicine			

TRACK 03: BIOMECHANICS AND ARTIFICIAL ORGANS							
SESSION DATE	TIME	ROOM		SESSION TITLE			
MONDAY, JUNE 8, 2015	15:00 - 16:15	701B	SP014	Bone Mechanics			
TUESDAY, JUNE 9, 2015	15:00 - 16:30	715A	SP055	Cellular & Molecular Mechanics			
	17:00 - 18:15	714B	SP066	Human Movement			
WEDNESDAY, JUNE 10, 2015	13:30 - 14:45	701B	SP089	Tissue Modelling			
THURSDAY, JUNE 11, 2015	17:00 – 19:00	714B	SP151	Cardio Mechanics & Organs			

TRACK 04: RADIATION ONCOLOGY

SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	08:00 - 09:45	701A	SP003	Brachy Therapy: Part 1
	08:00 – 09:15	718B	SP004	Quality Assurance: Part 1
	15:00 - 16:15	701A	SP015	Other Radiation Oncology: Part 1
	15:00 – 16:30	718B	SP016	Image Guided RT: Part 1
	17:00 – 19:00	718B	SP025	Dose Calculation: Part 1
TUESDAY, JUNE 9, 2015	08:00 - 10:00	718B	SP036	Treatment Planning – Motion and Robustness
	10:30 – 12:00	718B	SP046	Assessment of Radiotherapy Response
	10:30 – 12:00	701A	SP047	Dose Calculation: Part 2
	15:00 - 16:15	701A	SP056	Image Guided RT: Part 2
	15:00 – 16:45	718B	SP057	Quality Assurance: Part 2
	17:00 – 18:45	718B	SP072	Imaging
WEDNESDAY, JUNE 10, 2015	17:00 – 18:45	701A	SP106	PR: Proton Therapy
	17:00 – 18:45	718B	SP107	Beam Delivery
	10:30 – 12:00	701A	SP078	Brachy Therapy: Part 2
	10:30 – 12:00	718B	SP079	Motion Management: Part 1
	10:30 – 11:45	701B	SP080	Other Radiation Oncology: Part 2
THURSDAY, JUNE 11, 2015	08:00 - 19:15	718B	SP117	Treatment Planning – Knowledge Based
	10:30 - 12:00	718B	SP130	Treatment Planning
	10:30 - 12:15	701A	SP131	Quality Assurance: Part 3
	15:00 - 16:15	718B	SP140	Special Treatment Techniques: Part 1
	17:00 - 18:30	718B	SP152	Special Treatment Techniques: Part 2
	17:00 - 18:45	701A	SP153	Quality Assurance: Part 4
FRIDAY, JUNE 12, 2015	10:30 - 11:45	701A	SP174	Motion Management: Part 2
	10:30 - 11:45	718B	SP175	Treatment Planning – Biology & Fractionation

TRACK 05: DOSIMETRY	AND RADIAT	ION PROT	ECTION	
SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	08:00 - 09:15	715B	SP005	Patient Specific QA
	08:00 - 09:15	716A	SP006	Dosimetry in CT
	15:00 - 16:30	716A	SP017	Calculational Techniques in Therapy Dosimetry
	17:00 – 19:00	716A	SP026	Reference Dosimetry – Developments and Monitoring
	17:00 – 18:45	715B	SP027	Development and Application of Phantoms in Clinical Dosimetry
TUESDAY, JUNE 9, 2015	08:00 - 09:45	716A	SP037	Dosimetry in Nuclear Medicine
	08:00 - 09:15	715B	SP038	Dosimetry of Non-Standard Fields
	10:30 - 12:00	716A	SP048	Dosimetry of Protons and Heavy lons
	15:00 - 16:15	716A	SP058	Characterization of Detector Systems for Therapy Dosimetry: Part 1
	17:00 – 18:30	716A	SP067	Characterization of Detector Systems for Therapy Dosimetry: Part 2
	17:00 – 18:30	715B	SP068	Development of New Methods in Therapy Dosimetry
WEDNESDAY, JUNE 10, 2015	10:30 – 12:00	716A	SP081	Validation and Verification of Therapy Dose Delivery: Part 1
	13:30 – 15:00	716A	SP090	QA Measurements for Therapy Dosimetry
	15:00 – 16:30	716A	SP099	Special Session: Current situation of dosimetry in radiology and radia- tion protection
	15:00 – 16:00	716B	SP100	Dose Optimization: Focus on DRLs
	17:00 – 18:00	716A	SP108	Patient and Occupational Dose Assessment
	17:00 - 18:30	717A	SP109	Micro- and Nano-Dosimetry
THURSDAY, JUNE 11, 2015	08:00 - 09:30	715B	SP118	Diagnostic Radiology: Dosimetry and Quality Control
	08:00 - 10:00	716A	SP119	Dose Surveys in CT and Interventional Radiology
	10:30-11:30	715B	SP132	Special Session: Implementation of the new BSS including radiation safety culture in medicine
	10:30-11:30	716A	SP133	Validation and Verification of Therapy Dose Delivery: Part 2
	15:00 - 16:15	716A	SP141	Development of New Methods in Therapy Dosimetry: Part 3
	17:00 - 18:00	716A	SP154	Developments in Radiation Protection
	17:00 – 19:00	715B	SP155	Characterization of Detector Systems for Therapy Dosimetry: Part 3
FRIDAY, JUNE 12, 2015	08:00 - 10:00	716A	SP163	Primary Dosimetry Standards
	10:30 - 11:30	716A	SP176	Characterization of Detector Systems for Therapy Dosimetry: Part 4
	10:30 - 11:45	716B	SP177	Radiation Shielding – Design and Outcomes

TRACK 06: NEW TECHNOLOGIES IN CANCER RESEARCH AND TREATMENT						
SESSION DATE	TIME	ROOM		SESSION TITLE		
MONDAY, JUNE 8, 2015	15:00 – 16:30	717A	SP018	Small Animal Research Technologies		
	17:00 - 18:45	717A	SP028	HIFU Therapy, Microwave Ablation, Radiofrequency Ablation, Cryother- apy		
TUESDAY, JUNE 9, 2015	10:30 - 12:00	717B	SP049	Nanotechnology in Radiation Therapy and Imaging: Part 1		
	17:00 – 18:30	701A	SP069	Novel Detectors, Phantoms and Software, Diagnostic Techniques		
WEDNESDAY, JUNE 10, 2015	13:30 - 14:30	717B	SP091	Nanotechnology in Radiation Therapy and Imaging: Part 2		
THURSDAY, JUNE 11, 2015	15:00 – 16:15	701B	SP142	Light Ion Radiotherapy		
FRIDAY, JUNE 12, 2015	08:00 - 09:45	718B	SP164	Adaptive Radiation Therapy (ART)		

TRACK 07: SURGERY, COMPUTER AIDED SURGERY, MINIMAL INVASIVE INTERVENTIONS, ENDOSCOPY AND IM-AGE-GUIDED THERAPY, MODELLING AND SIMULATION

SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	17:00 - 18:45	715A	SP029	Surgical Navigation: Part 1
TUESDAY, JUNE 9, 2015	17:00 – 19:00	715A	SP073	Robotics and Virtual Reality in Surgery
WEDNESDAY, JUNE 10, 2015	17:00 – 18:45	715B	SP110	Surgical Navigation: Part 2
THURSDAY, JUNE 11, 2015	15:00 – 16:00	701A	SP143	Radiotherapy and Guidance
	17:00 - 18:45	715A	SP156	Patient-Specific Modeling and Simulation in Surgery

TRACK 08: BIOSENSOR, NANOTECHNOLOGY, BIOMEMS AND BIOPHOTONICS						
SESSION DATE	TIME	ROOM		SESSION TITLE		
MONDAY, JUNE 8, 2015	15:00 - 16:30	717B	SP019	Nanobiosensors and Nanotheranostics		
	17:00 – 19:00	717B	SP030	Lab-on-chip, BioMEMS and Microfluidics		
TUESDAY, JUNE 9, 2015	15:00 - 16:15	717B	SP059	Drug Delivery and Control Release		
THURSDAY, JUNE 11, 2015	10:30 - 11:45	717B	SP134	Biosignal Sensing and Body Sensor Networks		
	17:00 - 18:15	717B	SP157	Biochips and Blood Analysis

SESSION DATE	TIME	ROOM		SESSION TITLE				
MONDAY, JUNE 8, 2015	08:00 - 10:00	716B	SP007	Biomedical Signal Quality Analysis				
	15:00 - 16:15	716B	SP020	Biomedical Modeling				
	17:00 - 18:15	716B	SP031	Pattern Classification				
TUESDAY, JUNE 9, 2015	08:00 - 09:45	716B	SP039	ECG				
	10:30 - 12:15	716B	SP050	Time-Frequency Analysis				
	17:00 – 19:00	716B	SP074	Biomedical Monitoring & Bioelectromagnetism				
WEDNESDAY, JUNE 10, 2015	10:30 – 11:45	716B	SP082	Nonlinear Dynamic Analysis				
THURSDAY, JUNE 11, 2015	08:00 - 09:30	716B	SP120	Biomedical Diagnosis & Prediction				
	15:00 - 16:30	716B	SP144	EMG/MMG				
FRIDAY, JUNE 12, 2015	08:00 - 09:15	716B	SP165	EEG				

TRACK 10: REHABILITATION MEDICINE, SPORTS MEDICINE, REHABILITATION ENGINEERING AND PROSTHETICS

SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	08:00 - 10:00	715A	SP008	Spinal Cord / Brain Injury & Upper Limb Measurement and Treatments
TUESDAY, JUNE 9, 2015	08:00 - 09:30	715A	SP040	Ergonomics, Wearable Sensors and Virtual Reality
	10:30 – 11:30	715A	SP051	Rehabilitation Robotics
WEDNESDAY, JUNE 10, 2015	10:30 – 11:30	715B	SP083	Lower Limb Injury Assessment and Treatment & Prosthetics and Assis- tive Devices
THURSDAY, JUNE 11, 2015	15:00 – 17:00	715A	SP145	Developing Tools for Successful Aging: Independent Mobility & Visual Impairment

TRACK 11: NEUROENGINEERING, NEURAL SYSTEMS						
SESSION DATE	TIME	ROOM		SESSION TITLE		
MONDAY, JUNE 8, 2015	17:00 - 18:30	701B	SP032	Neural Interfaces and Regeneration		
TUESDAY, JUNE 9, 2015	08:00 - 09:45	714A	SP041	Brain Computer/Machine Interfaces		
	10:30 - 11:45	714A	SP052	Functional Neuroimaging and Neuronavigation		
WEDNESDAY, JUNE 10, 2015	13:30 - 14:45	717A	SP092	Neural Signal Processing: Part 1		
	15:00 - 16:45	717A	SP101	Stimulation and Monitoring		
THURSDAY, JUNE 11, 2015	08:00 - 09:45	714B	SP121	Deep Brain Stimulation		
	10:30 - 12:00	714B	SP135	Neural Signal Processing: Part 2		
FRIDAY, JUNE 12, 2015	08:00 - 09:45	714B	SP166	NeuroProstheses		
	10:30 - 12:00	715B	SP178	Neuroimaging, Neuronavigation and Neurological Disorders		

TRACK 12: MEDICAL DE	EVICES			
SESSION DATE	TIME	ROOM		SESSION TITLE
MONDAY, JUNE 8, 2015	15:00 – 16:45	715B	SP021	Public Health, Active and Healthy Aging
TUESDAY, JUNE 9, 2015	10:30 – 11:4 5	715B	SP053	Cardiovascular Instrumentation
	15:00 - 16:30	714B	SP060	Special Session: UNESCO International Year of Light
	15:00 - 16:45	715B	SP061	Improvement of Diagnosis and Therapies
WEDNESDAY, JUNE 10, 2015	10:30 - 12:00	717B	SP084	New Designing Ideas
	15:00 – 17:00	715A	SP102	Clinical Information Systems and Decision Support
	17:00 - 18:45	716B	SP111	Cardiovascular
	17:00 - 18:45	717B	SP112	Instrumentation
	10:30 - 11:30	716B	SP136	Brain, Head/Neck, Spine: Part 1
THURSDAY, JUNE 11, 2015	15:00 - 16:15	717B	SP146	MSK
FRIDAY, JUNE 12, 2015	08:00 - 10:00	715B	SP167	GI and GU
	08:00 - 09:45	717B	SP168	Health Challenges in Resource-Poor Nations
	08:00 - 09:45	701A	SP169	Self Engagement, Patient Empowerment and mHealth
	10:30 - 11:30	715B	SP179	Medical Devices: Miscellaneous

TRACK 14: INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT					
SESSION DATE	TIME	ROOM		SESSION TITLE	
WEDNESDAY, JUNE 10, 2015	17:00 – 19:00	715A	SP113	Information Technologies in Healthcare Delivery and Management: Part 1	
THURSDAY, JUNE 11, 2015	15:00 – 16:30	715B	SP147	Information Technologies in Healthcare Delivery and Management: Part 2	
FRIDAY, JUNE 12, 2015	08:00 - 09:30	715A	SP170	Information Technologies in Healthcare Delivery and Management: Part 3	
	10:30 – 11:30	715A	SP180	Information Technologies in Healthcare Delivery and Management: Part 4	

TRACK 15: BIOINFORMATICS					
SESSION DATE	TIME	ROOM		SESSION TITLE	
THURSDAY, JUNE 11, 2015	08:00 - 10:00	717B	SP122	Bioinformatics	

TRACK 16: CLINICAL ENGINEERING, CLINICAL PHYSICS, AND PATIENT SAFETY					
SESSION DATE	TIME	ROOM		SESSION TITLE	
MONDAY, JUNE 8, 2015	07:00 – 09:00	701B	SP009	Patient Safety, Medical Errors and Adverse Events Prevention Related to Health Technologies and Incident Analysis and Management	
TUESDAY, JUNE 9, 2015	08:00 - 09:45	701A	SP042	Technology Management Programmes and Equipment Management Systems	
	15:00 - 16:45	701B	SP062	Clinical Process Analysis, Optimization, Productivity and Benchmarking	
WEDNESDAY, JUNE 10, 2015	13:30 - 14:45	701A	SP093	Health Technology Assessment and Cost Effective Technologies for Developing Countries and Usability and Human Factors Engineering for Medical Devices and System Design: Part 1	
	15:00 - 16:15	701A	SP103	Health Technology Assessment and Cost Effective Technologies for Developing Countries and Usability and Human Factors Engineering for Medical Devices and System Design: Part 2	
THURSDAY, JUNE 11, 2015	08:00 - 09:45	701A	SP123	Patient Safety, Medical Errors and Adverse Events Prevention Related to Health Technologies	

TRACK 17: EDUCATIONAL AND PROFESSIONAL ACTIVITIES					
SESSION DATE	TIME	ROOM		SESSION TITLE	
MONDAY, JUNE 8, 2015	08:00 - 09:45	715A	SP010	Education and Training in Biomedical Engineering	
TUESDAY, JUNE 9, 2015	15:00-17:00	717A	SP063	Accreditation, Certification and Licensure Issues	
	17:00 – 19:00	713A	SP075	Special Session: Appropriate Technology in Imaging and Radiotherapy – Functionality and Safety Aspects	
THURSDAY, JUNE 11, 2015	17:00 – 19:00	717A	SP158	Educational Activities and Training in Medical Physics	
	08:00 - 09:30	717A	SP124	Medical Physics in Developing Countries	
	08:00 - 10:00	713A	SP125	Technology Enhanced Education	
	10:30 - 12:00	714A	SP137	Special Session: Building Medical Physics Capacity in Developing Countries	

TRACK 18: GENDER, SCIENCE AND TECHNOLOGY					
SESSION DATE	TIME	ROOM		SESSION TITLE	
MONDAY, JUNE 8, 2015	08:00 - 09:30	717A	SP011	Overview of Gender Roles in Medical Physics in North America	
TUESDAY, JUNE 9, 2015	08:00 - 09:30	717A	SP043	Women in BioMedical Engineering	
	10:30 – 12:00	717A	SP054	Women in Medical Physics: Current Status	
WEDNESDAY, JUNE 10, 2015	10:30 – 11:45	717A	SP085	Women in Medical Physics: Current Status	

TRACK 19: BIOPHYSICS AND MODELLING						
SESSION DATE	TIME	ROOM		SESSION TITLE		
TUESDAY, JUNE 9, 2015	17:15 – 19:00	717A	SP076	Radiobiological Modelling		
WEDNESDAY, JUNE 10, 2015	10:30 – 11:4 5	715A	SP086	Biological Effects of Ionizing Radiation		
	13:30 - 14:15	715A	SP094	Biological Modelling		
THURSDAY, JUNE 11, 2015	08:00 - 09:45	715A	SP126	Computational Biology & Hemodynamics		
	17:00 - 18:15	716B	SP159	Transport and Physiological Modelling		

PRESIDENT'S CALL	PRESIDENT'S CALL					
SESSION DATE	TIME	ROOM		SESSION TITLE		
MONDAY, JUNE 8, 2015	15:00 - 16:30	713B	SP022	Educational and Professional Activities: Part 1		
	17:00 – 18:15	713B	SP033	Imaging: Part 1		
TUESDAY, JUNE 9, 2015	15:00 - 16:15	713B	SP064	Biomechanics and Artificial Organs		
	17:00 - 18:45	713B	SP077	Radiation Oncology		
WEDNESDAY, JUNE 10, 2015	10:30 - 12:15	713B	SP087	Educational and Professional Activities: Part 2		
	13:30 – 15:15	713B	SP095	Biosignal Processing & Pulmonary & Respiratory		
	17:00 – 18:00	713B	SP114	Dosimetry and Radiation Protection		
THURSDAY, JUNE 11, 2015	08:00 – 09:30	713B	SP127	Informatics In Health Care And Public Health / Biosensor, Nanotechnol- ogy, Biomems And Biophotonics		
	10:30 - 11:45	713B	SP138	Biosensor, Nanotechnology, Biomems And Biophotonics / New Technol- ogies In Cancer Research And Treatment		
	15:00 – 16:30	713B	SP148	Medical Devices / Surgery, Computer Aided Surgery, Minimal Invasive Interventions, Endoscopy And Image-Guided Therapy, Modeling And Simulation		
	17:00 - 18:15	713B	SP160	Neuroengineering, Neural Systems / Biophysics And Modelling		
FRIDAY, JUNE 12, 2015	08:00 - 10:00	714A	SP171	Clinical Engineering / Physics, Patient Safety & Imaging		

SCIENTIFIC PROGRAM

SCIENTIFIC PROGRAM

Monday, June 8 2015

SESSION	I TIME:	08:00 - 09:30	08:3					
SESSION	I ROOM:	718A						
SESSION	I TRACK:	TRACK 01: IMAGING						
SESSION	I NAME:	SP001 - IMAGE PROCESSING AND VISUALIZATION: PART 1	09:0					
SESSION	I CHAIR(S)	: MARLEN PEREZ-DIAZ, CUBA	09:1					
08:00	Noise ir Images	1 - The Use of Wavelet Filters for Reducing Posterior Fossa Computed Tomography <i>Perez-Diaz, Cuba</i>	09:3					
08:15	Classifi	2 - Automatic Liver Localization based on cation Random Forest with KNN for Prediction g Jia, People's Republic of China						
08:30	Local R	3 - Brain Tumor Target Volume Segmentation: legion Based Approach n Aslian, Italy	SESS SESS SESS					
08:45	for the 3	SP001.4 - A Novel Automatic White Balance Algorithm for the 3D Image of Stereoscopic Endoscopy						
09:00		SP001.5 - A new log-compression rule for B-mode ultrasound imaging adjusted to the human visual system						
	Ramon	Fernandes, Brazil	08:0					
09:15	Analysi	6 - Comparison of Independent Component s (ICA) Algorithm for Heart Rate Measurement on Facial Imaging						
		ptiana, Indonesia	08:1					
SESSION		08:00 – 09:45	08:3					
	I ROOM:							
		TRACK 02: BIOMATERIALS AND REGENERATIVE MEDICINE	08:4					
SESSION	I NAME:	SP002 - STEM CELLS IN TISSUE ENGINEERING AND REGENERATION						
SESSION	I CHAIR(S)	: GILDA BARABINO, UNITED STATES ALICIA EL HAJ, UNITED KINGDOM	09:0					

Monday, June 8 2015

SP002.1 - KEYNOTE: Biomaterials and Regenerative

	Control	ne: Micro-environmental Modulation for led Cell Differentiation and Tissue Development Parabino, United States						
08:30	for rege tagging	SP002.2 - KEYNOTE: Defining the regulatory metrics for regenerative medicine using novel biomaterial tagging strategies <i>Alicia El Haj, United Kingdom</i>						
09:00	precurs	3 - The role of electric fields in promoting or cell migration to enhance wound repair <i>nie Iwasa, Canada</i>						
09:15	stem ce	P002.4 - The role of niche architecture on muscle em cell division orientation ichard Cheng, Canada						
09:30	SP002.5 - Mapping the Stem Cell's Mechanome using Paired Live Cell Multiplexed Imaging and Modeling <i>Melissa Knothe Tate, Australia</i>							
_	_							
SESSION	TIME:	08:00 - 09:45						
SESSION	ROOM:	701A						
SESSION	TRACK:	TRACK 04: RADIATION ONCOLOGY						
SESSION	NAME:	SP003 - BRACHY THERAPY: PART 1						
05001011								

08:00

- SESSION CHAIR(S): SIJI PAUL, INDIA Sook kien ng, united states
- 08:00 SP003.1 The impact of in-homogeneity corrected dose calculations for various clinical HDR brachytherapy sites. Siji Paul, India
 - 8:15 SP003.2 A novel QA device for brachytherapy applicator QA Sook Kien Ng, United States
- 08:30 SP003.3 Electromagnetic tracking for catheter reconstruction in ultrasound-guided high-dose-rate brachytherapy of the prostate *Alexandru Nicolae, Canada*
- 08:45 SP003.4 Dosimetric and radiobiological comparison of volumetric modulated arc therapy, high-dose-rate brachytherapy and low-dose-rate permanent seeds implant for localized prostate cancer *Ruijie Yang, People's Republic of China*
- 09:00 SP003.5 A novel system for real-time planning and guidance of breast HDR brachytherapy *Eric Poulin, Canada*

MONDAY JUNE 8 2015

09:15 SP003.6 - Investigation of electromagnetic catheter tracking approach for spatial reconstruction of implant geometry in high dose rate brachytherapy of prostate cancer

Gabor Fichtinger, Canada

09:30 SP003.7 - Endoscopic Tracking for improved Applicator Insertion in Esophagus and Lung HDR Brachytherapy *Robert Weersink, Canada*

SESSION TIME:	08:00 – 09:15
SESSION ROOM:	718B
SESSION TRACK:	TRACK 04: RADIATION ONCOLOGY
SESSION NAME:	SP004 – QUALITY ASSURANCE: PAR
SESSION CHAIR(S): STEFANO PECA, CANADA VELLAIYAN SUBRAMANI, INDIA

08:00 SP004.1 - In Vivo EPID Dosimetry Detects Interfraction Errors in 3D-CRT of Rectal Cancer Stefano Peca, Canada

RT 1

- 08:15 SP004.2 Establishing action thresholds for patient anatomy changes and machine errors during complex treatment using EPID and gamma analysis Ophélie Piron, Canada
- 08:30 SP004.3 Dosimetrical characteristics of amorphous silicon electronic portal imager for flattening filter free (FFF) photon beam of upgraded C-series Linear accelerator Vellian Subramani, India
- 08:45 SP004.4 Radiation field size, junction and MLC QA using amorphous silicon electronic portal imaging device, an efficient approach to improve routine accuracy Dany Simard, Canada
- 09:00 SP004.6 Real-time detection of deviations in radiotherapy beam delivery using a head-mounted detector *Richard Canters, Netherlands*

SESSION TIME:	08:00 – 09:15
SESSION ROOM:	715B
SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP005 – PATIENT SPECIFIC QA
SESSION CHAIR(S): DAVID ROGERS, CANADA

08:00 SP005.1 - Verifying dynamic planning in gamma knife radiosurgery using gel dosimetry *Gopishankar Natanasabapathi, India*

- 08:15 SP005.2 Influence of Jaw Tracking in Intensity Modulated and Volumetric Modulated Arc Radiotherapy for Head and Neck Cancers? A Dosimetric Study *Kh Anamul Hague, Bangladesh*
- **08:30** SP005.3 Evaluation of the eye lens dose according to patient setup errors in pediatric head CT examination *Rumi Gotanda, Japan*
- 08:45 SP005.4 Multi-Point Sources on Skin to Assess the Annual Effective Dose by Usage of TENORM added Pillow

Do hyeon Yoo, Republic of Korea

09:00 SP005.5 - Patient-Specific Quality Assurance of Respiratory-Gated VMAT Using a Programmable Cylindrical Respiratory Motion Insert for the ArcCHECK[™] Phantom *Heather Young, Canada*

SESSION TIME:	08:00 – 09:30
SESSION ROOM:	716A
SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP006 – DOSIMETRY IN CT
SESSION CHAIR(S): ÉTIENNE LÉTOURNEAU, CANADA JONATHAN BOIVIN, CANADA

- 08:00 SP006.1 KEYNOTE: Dosimetry and Radiation Protection Virginia Tsapakis, Greece
- 08:30 SP006.2 Organ dose reduction while using in-house CBCT patient-specific protocols based on OSL dosimetry Étienne Létourneau, Canada
- 08:45 SP006.3 A novel tool for in vivo dosimetry in diagnostic and interventional radiology using plastic scintillation detectors Jonathan Boivin, Canada
- **09:00** SP006.5 Assessment of patient's eye lens dose using a custom made anthropomorphic head phantom *Kwan Hoong Ng, Malaysia*
- 09:15 SP006.6 Dose Profile and Equilibrium Doses in CT *Ricardo Terini, Brazil*

_		
SESSION	I TIME:	08:00 – 10:00
SESSION	I ROOM:	716B
SESSION	I TRACK:	TRACK 09: BIOSIGNAL PROCESSING
SESSION	I NAME:	SP007 – BIOMEDICAL SIGNAL QUALITY ANALYSIS
SESSION	I CHAIR(S	5): OMAR ESCALONA, UNITED KINGDOM GEOFFREY CLARKE, CANADA
08:00		1 - KEYNOTE: Biosignal Processing Chan, Canada
08:30	wande	.2 - Adaptive filter for eliminating baseline r of pulse wave signals Akulova, Russian Federation
08:45	power distorti ECG	3 - Efficacy of DWT denoising in the removal of line interference and the effect on morphologica ion of underlying atrial fibrillatory waves in AF- Escalona, United Kingdom
09:00	Measu Oxime	4 - Quantifying Blood-Oxygen Saturation rement Error in Motion Contaminated Pulse try Signals ey Clarke, Canada
09:15	Electro Monito	5 - Signal Quality Indices for Ambulatory cardiograms used in Myocardial Ischemia rring ned Abdelazez, Canada
09:30	beats i	.6 - A simple algorithm for identifying artifact n long ECG recordings ao, People's Republic of China
09:45	Seismo	7 - Automatic Detection of Low-Quality ocardiogram Cycles Using the Outlier Approach Zakeri, Canada
SESSION	I TIME:	08:00 – 10:15
	ROOM:	
		TRACK 10: REHABILITATION MEDICINE, SPORTS MEDICINE, REHABILITATION ENGINEERING AND PROSTHETICS
SESSION	I NAME:	SP008 – SPINAL CORD / BRAIN INJURY & UPPER LIMB MEASUREMENT AND TREATMENTS
SESSION	I CHAIR(S	5): AUSTIN BERGQUIST, CANADA JAMES TUNG, CANADA
08:00	Stride and a F	.1 - A Validation Test of a Simple Method of Length Measurement Only with Inertial Sensors Preliminary Test in FES-assisted Hemiplegic Gai hi Watanabe, Japan
08:15	system a comp	.2 - A novel Treadmill Body Weight Support u using Pneumatic Artificial Muscle actuators: parison between active Body Weight Support and counter weight system

08:30	SP008.3 - A Serious Game for Training and Evaluating
	the Balance of Hemiparetic Stroke Patients
	Pedro Bertemes-Filho, Brazil

- 08:45 SP008.4 fNIRS-based analysis of brain activation with knee extension induced by functional electrical stimulation *Misato Ohdaira, Japan*
- **09:00** SP008.5 Muscle fatigability of isometric and isokinetic knee-extension generated by single-electrode- and spatially-distributed-sequential-stimulation *Austin Bergquist, Canada*
- 09:15 SP008.6 External modulation of electrical stimulated spinal reflexes - a control modality for human lumbosacral networks in injury induced disconnection from brain control *Winfried Mayr, Austria*
- 09:30 SP008.7 Motor Control Assessment using Leap Motion: Filtering Methods and Performance in Indoor and Outdoor Environments Jone Kim, Canada
- 09:45 SP008.8 Biceps brachii EMG signals: estimation of dipole sources *Peyman Aghajamaliaval, Canada*
- 10:00 SP008.9 Validating a Solid-Static Single-Armed Male Prototype Tasked to Produce Dynamic Movement from the Shoulder Through the Preparation Phase *Alicia Gal, Canada*

SESSION TIME:	08:00 - 09:00
SESSION ROOM:	701B
SESSION TRACK:	TRACK 16: CLINICAL ENGINEERING, CLINICAL PHYSICS, AND PATIENT SAFETY
SESSION NAME:	SP009 - PATIENT SAFETY, MEDICAL ERRORS AND ADVERSE EVENTS PREVENTION RELATED TO HEALTH TECHNOLOGIES AND INCIDENT ANALYSIS AND MANAGEMENT
SESSION CHAIR(S): MARY COFFEY, IRELAND

- 08:00 SP009.1 Technological Surveillance and Integrity Monitoring of Infusion Systems David Grosse-Wentrup, Germany
- **08:15** SP009.2 Evaluating Patient Safety Risks Related to Oral Chemotherapy: Evolution of a Human Factors Informed Failure Mode and Effects Analysis Framework *Melissa Griffin, Canada*
- 08:30 SP009.3 Alarm Management Study in Pediatric Special Care Unit *Christopher Bzovey, Canada*
- 08:45 SP009.4 Failure Modes and Effect Analysis for Stereotactic Radiosurgery: a comparison among three radiotherapy centers in Brazil. *Flavia Cristina Teixeira, Brazil*

Thuc Tran, Japan

SESSION TIME:	08:00 – 09:45
SESSION ROOM:	715A
SESSION TRACK:	TRACK 17: EDUCATIONAL AND PROFESSIONAL ACTIVITIES
SESSION NAME:	SP010 – EDUCATION AND TRAINING IN BIOMEDICAL ENGINEERING
SESSION CHAIR(S): SHANKAR KRISHNAN, UNITED STATES MLADEN POLUTA, SOUTH AFRICA

	Kenneth Nkuma-Udah, Nigeria
	A Developmental Overview
08:00	SP010.1 - Biomedical Engineering in Nigeria:

08:15 SP010.2 - Biomedical Engineering Education in Peru in 2015: A Unique and Innovative Collaboration in Latin America

Rossana Rivas, Peru

- 08:30 SP010.3 Improving Biomedical Engineering in Uganda through education, benchmarking and mentorship *Robert Ssekitoleko, Uganda*
- 08:45 SP010.4 Designing Biomedical Engineering Programs to Prepare for Medtech Industry Shankar Krishnan, United States
- 09:00 SP010.5 BME vs CE vs HTM vs HbHTA vs EAM. What's in a Name and does it matter? *Mladen Poluta, South Africa*
- 09:15 SP010.6 Clinical Engineering Certification Program in the Americas Frank Painter, United States
- 09:30 SP010.7 Biomedical Technology Online Courses for the Americas Tobey Clark, United States

SESSION TIME: 08:00 - 09:30

SESSION ROOM: 717A

- SESSION TRACK: TRACK 18: GENDER, SCIENCE AND TECHNOLOGY
- SESSION NAME: SP011 OVERVIEW OF GENDER ROLES IN MEDICAL PHYSICS IN NORTH AMERICA

SESSION CHAIR(S): PATRICIA TRBOVICH, CANADA KRISTY BROCK, UNITED STATES

- 08:00 SP011.1 KEYNOTE: Gender, Science and Technology: The Role of Women in Medical Physics *Kristy Brock, United States*
- 08:30 SP011.2 Biography of Women in Medical Physics: Maryellen Giger, Ph.D. Maryellen Giger, United States
- 08:45 SP011.3 My STEM story: from Martinique in the Caribbean to Quebec City, through France and Vietnam *Nadia Octave, Canada*

- 09:00 SP011.4 My strategies for living (and enjoying) academic research Rebecca Fahrig, United States
- 09:15 SP011.5 Early exposure to science leads to fulfilling career in medical physics *Renee Larouche, Canada*

SESSION TIME:	15:00 – 16:00
SESSION ROOM:	718A
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP013 – MRI: METHODS
SESSION CHAIR(S): ZOFIA DRZAZGA, POLAND CHEMSEDDINE FATNASSI, SWITZERLAND

- 15:00 SP013.1 Numerical Simpson's Rule for Real Time and Accurate T2* maps generation Using 3D Quantitative GRE *Chemseddine Fatnassi, Switzerland*
- 15:15 SP013.2 Optimization of Pulse-Triggered fMRI Measurement Delay with Acoustic Stimulation *Zofia Drzazga, Poland*
- 15:30 SP013.3 Improvement of Pseudo Multispectral Classification of Brain MR Images Chemseddine Fatnassi, Switzerland
- 15:45 SP013.4 Image reconstruction of RF encoded MRI signals in an inhomogeneous B0 field Somaie Salajeghe, Canada

SESSION TIME:	15:00 – 16:15
SESSION ROOM:	701B
SESSION TRACK:	TRACK 03: BIOMECHANICS AND ARTIFICIAL Organs
SESSION NAME:	SP014 – BONE MECHANICS
SESSION CHAIR(S):	JIE YAO, PEOPLE'S REPUBLIC OF CHINA

- 15:00 SP014.1 KEYNOTE: Biomechanics and Artificial Organs Yubo Fan, People's Republic of China
- **15:30** SP014.2 Improved Semi-automated 3D Kinematic Measurement of Total Knee Arthroplasty Using X-ray Fluoroscopic Images *Takaharu Yamazaki, Japan*
- **15:45** SP014.3 The influence of screw length and stiffness on the tibial mechanical environment in ACL reconstruction *Jie Yao, People's Republic of China*
- 16:00 SP014.4 A new method for determining the effect of follower load on the range of motions in the lumbar spine Cheng-fei Du, People's Republic of China

SESSION	N ROOM: 701A
	N TRACK: TRACK 04: RADIATION ONCOLOGY
	NAME: SP015 – OTHER RADIATION ONCOLOGY: PART 1
SESSION	N CHAIR(S): ESTEBAN BOGGIO, ARGENTINA
15:00	SP015.1 - Beta Enhancers: towards a local dose enhancer device for Boron Neutron Capture Therapy (BNCT) on superficial tumors Esteban Boggio, Argentina
15:15	SP015.2 - Nanoparticle Enhanced Radiation Therapies Is There a Synergy with Chemotherapies? <i>Linda Rogers, Australia</i>
15:30	SP015.3 - Change in Hounsfield Units due to lung expansion as a predictor of LAD and heart displacement in patients undergoing deep inspiration breath hold for left sided breast cancer Peta Lonski, Australia
15:45	SP016.4 - Samarium-153 Labelled Microparticles for Targeted Radionuclide Therapy of Liver Tumor <i>Chai Hong Yeong, Malaysia</i>
16:00	SP016.5 - Anatomical Modelling of the Pregnant Radiotherapy Patient
SESSION	Tanya Kairn, Australia
SESSION	Tanya Kairn, Australia N TIME: 15:00 – 16:30 N ROOM: 718B

TUESDAY JUNE 9 2015

SCIENTIFIC PROGRAM

08:30	SP042.3 - Development of a scoring system to support medical equipment replacement prioritization using the Analytical Hierarchy Process (AHP) Paul Prowse, Canada	10:30 10:45	SP044.1 - Personal Time-Varying Magnetic Fields Evaluation During Activities in MRI Sites <i>Giuseppe Acri, Italy</i> SP044.2 - ECG Imaging of Ventricular Extrasystoles
08:45	SP042.4 - Multi-criteria decision analysis to redesign an Italian Clinical Engineering Service under specific needs and regulation requirements <i>Irene Lasorsa, Italy</i>	11:00	Olaf Doessel, Germany SP044.3 - Experimental Study on Amplitude Frequency of Acoustic Signal Excited by Coupling Magneto- Acoustic Field
09:00	SP042.5 - Developing a system to support equipment repair versus replacement decision making Sarah Kelso, Canada	11:15	<i>Zhipeng Liu, People's Republic of China</i> SP044.4 - In vivo electric conductivity values of cervical cancer patients reconstructed with a 3T MR
09:15	SP042.6 - An assessment of Preventive and Performance Maintenance Of Theater Equipment In Public Hospitals Kenya: Case study Five Public Hospitals.	11:30	system for improved SAR determination <i>Edmond Balidemaj, Netherlands</i> SP044.5 - Focus Tunable Gel Lens Using Annular Dielectric Elastomer Actuator
09:30	Philip Anyango, Kenya SP042.7 - Mathematical Model for Reliable Maintenance of Medical Equipment Abdelbaset Khalaf, South Africa	11:45	Thanh Giang La, Singapore SP044.6 - Ultra-low-field MRI for improving spatial accuracy of bioelectric source imaging Koos Zevenhoven, Finlandia

	SESSION	TRACK:	TRACK 06: NEW TECHNOLOGIES IN CANCER RESEARCH AND TREATMENT			
	SESSION	NAME:	SP049 – NANOTECHNOLOGY IN RADIATION THERAPY AND IMAGING: PART 1			
	0-0.01					

- 10:30 SP049.1 - A plasma electrochemistry reactor enabling the rapid, efficient, automatic and on-site synthesis of radioactive gold nanoparticles for brachytherapy treatments Mathieu Bouchard, Canada
- 10:45 SP049.2 - Dose Enhancement in Radiotherapy by Novel Application Of Gadolinium Based MRI Contrast Agent Nanomagnetic Particles in Gel Dosimetry Nader Riyahi Alam, Iran
- 11:00 SP049.3 - Monte Carlo simulation of the radiosensitizing effect by gold nanoparticles: comparison between proton and X-ray irradiation Jihun Kwon, Japan
- 11:15 SP049.4 - Colloidal quantum dots: radiation resistant nano-scintillators for radiation-based applications Marie-Ève Delage, Canada
- 11:30 SP049.5 - Use of gold nanoparticles and pHLIP (pH Low Insertion Peptide) to increase radiation effectiveness in cancer cells. Michael Antosh, United States
- 11:45 SP049.6 - The use of nanoparticles to improve hadrontherapy Marta Bolsa-Ferruz, France

SESSION TIME:	10:30 – 11:30
SESSION ROOM:	715A
SESSION TRACK:	TRACK 10: REHABILITATION MEDICINE, SPORTS MEDICINE, REHABILITATION ENGINEERING AND PROSTHETICS
SESSION NAME:	SP051 – REHABILITATION ROBOTICS
SESSION CHAIR(S	: YAHIA AL-SMADI, UNITED STATES

- SP051.1 Biomechanical Simulation of Upper 10:30 Extremities Exoskeleton to Aid Stroke Patients Yahia Al-Smadi, United States
- 10:45 SP051.2 - Testing a mobile robot toy for children with disabilities William Rodríguez, Colombia
- 11:00 SP051.3 - Pilot study of a soft metal hydride actuator for a wearable rehabilitation system Minako Hosono, Japan
- SP051.4 Robotic Spasticity Quantification: Velocity 11:15 Dependent Component of Biomechanical Resistance Nitin Seth, Canada

- SESSION TIME: 10:30 - 12:15
- SESSION ROOM: 716B
- SESSION TRACK: TRACK 09: BIOSIGNAL PROCESSING
- SESSION NAME: SP050 TIME-FREQUENCY ANALYSIS
- **NITISH THAKOR, SINGAPORE** SESSION CHAIR(S): SRI KRISHNAN, CANADA
- 10:30 SP050.1 - KEYNOTE: Frontiers of Neuroengeneering Nitish Thakor, Singapore
- 11:00 SP050.2 - Neural responses to hearing own names comparing with repeated/non-repeated unfamiliar stimuli Kaori Tamura, Japan
- 11:15 SP050.3 - MRS data deconvolution through KBDM with multiple signal truncation and clustering: circumventing noise effects Danilo Da Silva, Brazil
- 11:30 SP050.4 - Quantification of Wavelet Band Metrics for Assessing Heart Rate Variability Mark Wachowiak, Canada
- 11:45 SP050.5 - Effect of Coffee on EEG Spectral Asymmetry Maie Bachmann, Estonia
- 12:00 SP050.6 - Effects of Changing in the Neck Fluid Volume, Neck Circumference and Upper Airway during Sleep on Snoring Sound Characteristics Zahra Moussavi, Canada

SESSION TIME:	10:30 - 11:45
SESSION ROOM:	714A
SESSION TRACK:	TRACK 11: NEUROENGINEERING, NEURAL Systems
SESSION NAME:	SP052 – FUNCTIONAL NEUROIMAGING AND NEURONAVIGATION
SESSION CHAIR(S): ERVIN SEJDIC, UNITED STATES HOSSEIN ROUHANI, CANADA

- 10:30 SP052.1 - KEYNOTE: From human neuron to human brain: Neurosurgical contributions to understanding the brain Taufik Valiante, Canada
- SP052.2 Modulation of event-related 11:00 desynchronization and synchronization during right finger flexion in patients with Amyotrophic Lateral Sclerosis Natasa Bizovicar, Slovenia
- 11:15 SP052.3 - Functional connectivity patterns associated with swallowing of fluids with various viscosity Ervin Sejdic, United States
- 11:30 SP052.4 - Distribution of F-Latency (DFL) - a new nerve conduction parameter for early detection of radiculomvelopathv K Siddique Rabbani, Bangladesh

SCIENTIFIC PROGRAM

WEDNESDAY JUNE 10 2015

- 14:15 SP095.4 A Robust and Realistic Framework for Clinical Classification of Myocardial Infarction Yasin Mamatjan, Canada
- 14:30 SP095.5 A Mother Wavelet Selection Algorithm for Respiratory Rate Estimation from Photoplethysmogram *Dan Guo, People's Republic of China*
- 14:45 SP095.6 Mathematical assessment of variability in respiratory airflow patterns Saravana Raman, United States
- 15:00 SP095.7 Spectral Analysis of Respiratory and Cardiac Signals Using Doppler Radar *Philip Tworzydlo, Canada*

SESSION TIME: 15:00 - 16:15

SESSION ROOM: 718A

SESSION TRACK: TRACK 01: IMAGING

SESSION NAME: SP096 - OPTICAL IMAGING: APPLICATIONS

SESSION CHAIR(S): SANTA BOREL, CANADA JESSICA PEREZ, CANADA

15:00 SP096.1 - Live-cell Raman microspectroscopy to differentiate between normal and malignant ovarian surface epithelial cells Santa Borel, Canada

- **15:15** SP096.2 Quantitative image analysis of fluorescence endomicroscopy video sequences for mesenchymal stem cell tracking in regenerative lung treatment *Jessica Perez, Canada*
- 15:30 SP096.3 Shape-Based Diffuse Optical Tomography for Reconstruction of Photothermal Lesions in Prostate Focal Therapy *Robert Weersink, Canada*
- 15:45 SP096.4 Transrectal diffuse optical tomography to monitor photocoagulation during interstitial photothermal theraphy of focal prostate cancer *Robert Weersink, Canada*
- 16:00 SP096.5 The first in vivo, optical images of neuroblasts migrating away from the subventricular zone deep in mouse brain reveal two patterns of migration: implications for future therapeutic use *Teresa Murray, United States*

SESSION TIME:	15:00 – 17:00
SESSION ROOM:	701B
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP097 – QUANTITATIVE IMAGING: PART 2
SESSION CHAIR(S): HAI-LING MARGARET CHENG, CANADA GEOFFREY ZHANG, UNITED STATES

- 15:00 SP097.1 Ischemia-time dependent CBF threshold for infarction determined in a porcine model of stroke using CT Perfusion and F-18 FFMZ PET imaging *Eric Wright, Canada*
- **15:15** SP097.2 Characterization of scatter factors in thyroid studies using a pinhole collimator by Monte Carlo Simulation. *Aley Palau, Cuba*

Aley Palau, Cuba

- 15:30 SP097.3 Fluid Quantification Using Temporal Subtraction: Comparing Single to Dual-Energy Digital Chest Radiography Shailaja Sajja, Canada
- 15:45 SP097.4 Quantitative low-kVp CT angiography in carotid artery imaging *Tianye Niu, People's Republic of China*
- 16:00 SP097.5 Evaluation of the ΔV Ventilation Calculation Method Using In Vivo XeCT Ventilation Data *Geoffrey Zhang, United States*
- 16:15 SP097.6 Predicting Survival Outcomes of Post-Treatment Glioma Patients by Quantification of Viable Tumour Volume on CMET/FLT PET and MRI. Christopher Leatherday, Australia
- 16:30 SP097.7 A Novel Method for Lung's Air Volume Estimation in Exhalation and Inhalation Phases From CT Imges *Elham Karami, Canada*
- 16:45 SP097.8 High-resolution micro-CT protocol for assessing lung ventilation and perfusion: image subtraction versus multi-energy analysis *Nancy Ford, Canada*

SESSION TIME:	15:00 – 16:45

SCIENTIFIC PROGRAM

SCIENTIFIC PROGRAM **BY DAY**

Thursday, June 11 2015

	TIME.	00.00 10.00	
SESSION		08:00 – 10:00	
SESSION	ROOM:	718A	
SESSION	TRACK:	TRACK 01: IMAGING	
SESSION	NAME:	SP115 – CT IMAGE QUALITY AND DOSE OPTIMIZATION	
SESSION	CHAIR(S): ANA MARIA MARQUES DA SILVA, BRAZIL	
08:00	Full Fie	1 - Towards Image Quality Analysis of Small and Id of View Dental Cone Beam CT Systems aria Marques Da Silva, Brazil	
08:15	SP115.2 - Rapid non-invasive spatially varying HVL measurements for CT sources <i>Matthew Randazzo, United States</i>		
08:30	SP115.3 - Development of a CT protocol management system for automated review of CT scanner protocols <i>Josh Grimes, United States</i>		
08:45	SP115.4 - Evaluation of automatic exposure control systems in computed tomography <i>Paulo Costa, Brazil</i>		
09:00	SP115.5 - Development of a Software for Image Quality Assessment in Computed Tomography using the Catphan500® Phantom <i>Paulo Costa, Brazil</i>		
09:15	SP115.6 - Performance of attenuation-based dynamic CT beam-shaping filtration for elliptical subject geometries in dependence of fan- and projection-angle <i>Stella Veloza, Colombia</i>		
09:30	detecti	7 - A software tool for automated artifact on in scans of the CT daily water phantom rimes, United States	

09:45 SP115.8 - Monte Carlo Simulation of X-ray Spectra in Computed Tomography Scanner using GATE Mohammad Reza Ay, Iran

SESSION TIME:	08:00 – 10:00
SESSION ROOM:	701B
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP116 – IMAGE PROCESSING AND VISUALIZATION: PART 2
SESSION CHAIR(S): YIWEN XU, CANADA

Thursday, June 11 2015

- 08:00 SP116.1 - Automated segmentation of whole-slide histology for vessel morphology comparison Yiwen Xu, Canada
- 08:15 SP116.2 - Using Gamma Maps of Anatomy to Highlight Changes in Anatomy During Image-Guided Adaptive Radiotherapy: Head and neck example Jeff Kempe, Canada
- 08:30 SP116.3 - Improvement of Ventricle Volumetric Calculation and Visualization in Cardiac MRI William Rae, South Africa
- 08:45 SP116.4 - Inter-operator variability of 3D prostate magnetic resonance image segmentation using manual and semi-automatic approaches Maysam Shahedi, Canada
- 09:00 SP116.5 - Derivation of Residual Noise of Filtered Poisson and Gaussian Series Weiguang Yao, United States
- 09:15 SP116.6 - Fast Registration of Intraoperative Ultrasound and Preoperative MR Images Based on Calibrations of 2D and 3D Ultrasound Probes Fang Chen, People's Republic of China
- 09:30 SP116.7 - Development of digital subtraction angiography for coronary artery without motion artifacts enabling read-time processing Megumi Yamamoto, Japan
- 09:45 SP116.8 - Real-time measurement of cardiomyocyte contraction and calcium transients using fast image processing algorithms Ivo Provazník, Czech Republic

SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP133 – VALIDATION AND VERIFICATION OF THERAPY DOSE DELIVERY: PART 2
SESSION CHAIR(S): SARFEHNIA ARMAN, CANADA JAMES CHOW, CANADA

Panelists: SP133.1 - James Chow, Canada SP133.2 - Michel Lalonde, Canada SP133.3 - Kamlesh Passi, India SP133.4 - Nader Moshiri Sedeh, United States

SESSION	TIME:	10:30 – 11:45
SESSION	ROOM:	717B
SESSION	TRACK:	TRACK 08: BIOSENSOR, NANOTECHNOLOGY, BIOMEMS AND BIOPHOTONICS
SESSION	NAME:	SP134 – BIOSIGNAL SENSING AND BODY Sensor Networks
SESSION	CHAIR(S)	: KWANG OH, UNITED STATES Jonathan Lovell, United States
10:30	electroo	- Impedance and comfort of dry multipin des for electroencephalography e Fiedler, Germany

- 10:45 SP134.2 Wearable Gait Analysis using Vision-aided Inertial Sensor Fusion *Eric Ma, Canada*
- 11:00 SP134.3 Two-Vector Capacitive Electrocardiogram Measurement Using Three Fabric Electrodes for Automobile Application Shunsuke Takayama, Japan
- 11:15 SP134.5 Detection of REM Behaviour Disorder Based on Low-Power Compressive Sensing of EMG Sridhar Krishnan, Canada
- 11:30 SP134.6 Externally applied pressure on the skin electrode impedance Bahareh Taji, Canada

SESSION	TIME:	10:30 – 12:00
SESSION	ROOM:	714B
SESSION	TRACK:	TRACK 11: NEUROENGINEERING, NEURAL SYSTEMS
SESSION	NAME:	SP135 – NEURAL SIGNAL PROCESSING: PART 2
SESSION	CHAIR(S)	: MILOS POPOVIC, CANADA Angelo All, Singapore
10:30	the gen extracte	 Epileptogenic zone estimation by localizing erators of delta and high-frequency rhythms of from human scalp EEG Jacobs, Canada
10:45	Using a Device	2 - Automated Alzheimer's Disease Diagnosis Portable 7-Channel Electroencephalography ndo Cassani, Canada
11:00	Culture Chamb	3 - Transient Propagation of Information Among d Hippocampal Cell Assemblies in a Two- er MEMs Device <i>Wheeler, United States</i>
11:15	Pre-Mo	4 - Investigating the Cortical Dominance in the tor Potential during Unilateral Voluntary Task Dinfantosi, Brazil
11:30	to Evok Posture	5 - A New Dynamic Virtual Stimulation Protocol e M-VEP and Linear Vection during Orthostatic Control o Infantosi, Brazil
11:45	Enhanc Injury U	6 - Assessment of Bilateral SSEP Signals ement following Transectional Spinal Cord sing Linear Modeling <i>All, Singapore</i>
SESSION	TIME:	10:30 – 11:30
SESSION	ROOM:	716B
SESSION	TRACK:	TRACK 12: MEDICAL DEVICES
SESSION	NAME:	SP136 – BRAIN, HEAD/NECK, SPINE: PART 1
SESSION	CHAIR(S)	: ANDREAS SCHMOCKER, SWITZERLAND FRANCIS BAMBICO, CANADA

- 10:30 SP136.1 Photopolymerization device for minimally invasive implants: application to nucleus pulposus replacement Andreas Schmocker, Switzerland
- **10:45** SP136.2 Design and Technical Evaluation of an Implantable Passive Sensor for Minimally Invasive Wireless Intracranial Pressure Monitoring *Mohammadhossein Behfar, Finlandia*
- 11:00 SP136.3 Investigating the Feasibility of EVestG Assessment for Screening Concussion Zahra Moussavi, Canada

11:15	Rat Me	4 - Transcranial Direct Current Stimulation of the dial Prefrontal Cortex: Antidepressant Effects gional Brain Changes	SESSION	N TIME:	10:30 - 11:45		
		s Bambico, Canada	SESSION	NROOM:	713B

			15:30	camera imaging	3 - Development of a hybrid optical-gamma a: A new innovation in bedside molecular g o Ng, Malaysia		
			15:45	SP139.	4 - Sidestream Dark-Field Oximetry with lor LEDs		

Tomohiro Kurata, Japan

► THURSDAY JUNE 11 2015

SCIENTIFIC PROGRAM

THURSDAY JUNE 11 2015

- 16:00 SP139.5 Development of Polymer Substrates for Waveguide Evanescent Field Fluorescence Microscopy *Rony Sharon, Canada*
- 16:15 SP139.6 Higher-Order Structural Investigation of Mammalian Septins by Super-Resolution Fluorescence Microscopy Adriano Vissa, Canada

SESSION TIME:	15:00 – 16:15
	7100
SESSION ROOM:	/ 18B
SESSION TRACK	TRACK 04: RADIATION ONCOLOGY
SESSION NAME:	SP140 – SPECIAL TREATMENT TECHNIQUES:
	PART 1
SESSION CHAIR(S): WILLIAM Y. SONG, CANADA

- 15:00 SP140.1 Credentialing of radiotherapy centres in Australasia for a phase III clinical trial on SABR *Tomas Kron, Australia*
- 15:15 SP140.2 LED-optimized SBRT for Peripheral Early Stage Lung Cancer: A technique to reduce lung dose and potentially allow for re-irradiation *Brandon Disher, Canada*
- **15:30** SP140.3 Delivery of VMAT treatments with nonstandard SAD using dynamic trajectories *Joel Mullins, Canada*
- 15:45 SP140.4 Cone-Beam CT assessment of inter-fraction and intra-fraction motions during lung stereotactic body radiotherapy with and without abdominal compression *Runging Jiang, Canada*
- **16:00** SP140.5 Initial experience in establishing frameless intra-cranial stereotactic radiosurgery program with Varian TrueBeam STx , 6DoF couch and VisionRT motion control system **Sergei Zavgorodni, Canada**

SESSION TIME:	15:00 – 16:15
SESSION ROOM:	716A
SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP141 – DEVELOPMENT OF NEW METHODS IN THERAPY DOSIMETRY: PART 3
SESSION CHAIR(S): NICOLE RANGER, UNITED STATES SIMONE KODLULOVICH, BRAZIL

15:00 SP141.1 - Theoretical description of the saturation correction of ionization chambers in pulsed fields with arbitrary repetition rate *Leonhard Karsch, Germany* **15:15** SP141.2 - Performance characteristics of Gafchromic EBT3 film in therapeutic electron beams and its practical application as an in-vivo dosimeter in the clinic

Amanda Barry, Ireland

15:30 SP141.3 - Photon and electron spectra inside small field detectors for narrow and broad 6 MV photon beams

Hamza Benmakhlouf, Sweden

- 15:45 SP141.4 Real Time Dose Reconstruction in MV Photon Therapy using a 2D solid state detector array. *Michael Lerch, Australia*
- **16:00** SP141.5 Energy Correction factor for Plane Parallel ion-chamber and its Use in Clinical photon Beam Dosimetry

Kamlesh Passi, India

SESSION TIME:	15:00 – 16:15
SESSION ROOM:	701B
SESSION TRACK:	TRACK 06: NEW TECHNOLOGIES IN CANCER RESEARCH AND TREATMENT
SESSION NAME:	SP142 – LIGHT ION RADIOTHERAPY
SESSION CHAIR(S): ALBIN FREDRIKSSON, SWEDEN YOLANDA PREZADO, FRANCE

- 15:00 SP142.1 Proton Minibeam Radiation Therapy (pMBRT): implementation at a clinical center *Yolanda Prezado, France*
- 15:15 SP142.2 Hadron minibeam radiation therapy: feasibility study at Heidelberg Ion Therapy Center *Yolanda Prezado, France*
- **15:30** SP142.3 Acoustic Range Verification of Proton Beams: Simulation Assessment of the Challenges of Clinical Application *Kevin Jones, United States*
- 15:45 SP142.4 Radiochromic Film Based Dose Calibration and Monitoring for Radiobiological Experiments using Low Energy Proton Beams Belal Moftah, Saudi Arabia
- 16:00 SP142.5 Development of 3D measurement device dedicated for range-compensator QA *Shigekazu Fukuda, Japan*

SCIENTIFIC PROGRAM

- 15:45 SP146.4 Electrical Stimulation of the Calf Muscle to Reduce Seated Leg Fluid Accumulation and Subsequent Rostral Fluid Shift While Supine Daniel Vena, Canada
- **16:00** SP146.5 Surgical process analysis identifies lack of connectivity between sequential fluoroscopic 2D alignment as a critical impediment in femoral intramedullary nailing *Hamid Ebrahimi, Canada*

SESSION TIME:	15:00 – 16:30
SESSION ROOM:	715B
SESSION TRACK:	TRACK 14: INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT
SESSION NAME:	SP147 – INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT: PART 2

- SESSION CHAIR(S): BRUCE CURRAN, UNITED STATES JOSEPH CAFAZZO, CANADA
- 15:00 SP147.1 KEYNOTE: The Electronic Medical Record: Can it be integrated with Treatment Delivery and Management? Bruce Curran, United States
- 15:30 SP147.2 AIM Quality Assurance Program Development for CT X-Ray Systems Douglas McTaggart, Canada
- 15:45 SP147.3 Evaluation of Improved Automatic Speech Recognition Prototype for Estonian Language in Radiology Domain Andrus Paats, Estonia
- 16:00 SP147.4 Usability engineering approach towards secure open networks in the integrated operating room of the future *Klaus Radermacher, Germany*
- 16:15 SP147.5 Whiteboard ESB: Next Generation Data and Workflow Management for Radiation Oncology John Wolfgang, United States

SESSION TIME:	15:00 – 16:30
SESSION ROOM:	713B
SESSION TRACK:	PRESIDENT'S CALL
SESSION NAME:	SP148 - MEDICAL DEVICES / SURGERY, COMPUTER AIDED SURGERY, MINIMAL INVASIVE INTERVENTIONS, ENDOSCOPY AND IMAGE-GUIDED THERAPY, MODELING AND SIMULATION
SESSION CHAIR(S)	: GIDEON NDUBUKA, NIGERIA

15:00 SP148.1 - Oncometer Priyajit Ghosh, India

- 15:15 SP148.2 Ways to outreach medical devices in low resource countries (LRC) *K Siddique Rabbani, Bangladesh*
- **15:30** SP148.3 South African-Swedish effort on pre-hospital diagnostics of stroke and traumatic injuries *Mikael Persson, Sweden*
- **15:45** SP148.4 A portable multi-frequency impedance measuring device for biodynamic analysis *Takao Nakamura, Japan*
- 16:00 SP148.5 A Study of the Challenges of Donating Medical Equipment to Developing Countries *Bill Gentles, Canada*
- 16:15 SP148.6 The Clinicopathologic Characters and Activity Survey of Sudden Death of Infant in a Depressed Economy: South-Eastern Nigeria Experience.
 Gideon Ndubuka, Nigeria

SESSION TIME:	17:00 – 18:45
SESSION ROOM:	718A
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP149 – ITERATIVE RECONSTRUCTION
SESSION CHAIR(S): IDRIS ELBAKRI, CANADA DMITRI MATENINE, CANADA

- 17:00 SP149.1 Preliminary study on reduction of cartoon artifact in the iteratively reconstructed images from sparse projection views *Sunhee Wi, Republic of Korea*
- 17:15 SP149.2 Evaluation of the OSC-TV Reconstruction Algorithm for Optical Cone-Beam Computed Tomography *Dmitri Matenine, Canada*
- 17:30 SP149.3 Subjective low contrast performance of four CT scanners with iterative reconstruction *Azeez Omotayo, Canada*
- 17:45 SP149.5 Sparse-view image reconstruction with compressed sensing and its application in low dose CT myocardial perfusion imaging *Esmaeil Enjilela, Canada*
- 18:00 SP149.6 Feasibility study for 3D cone-beam computed tomography reconstruction with few projection data using MLEM algorithm with total variation minimization Dong Hoon Lee, Republic of Korea
- 18:15 SP149.7 A weighted stochastic gradient descent algorithm for image reconstruction in 3D computed tomography Davood Karimi, Canada
- **18:30** SP149.8 Investigation of sparse-angle view in cone beam computed tomography (CBCT) reconstruction algorithm using a sinogram interpolaton method *Dohyeon Kim, Republic of Korea*

SESSION	TIME:	17:00 – 18:45
SESSION	R00M:	701B
SESSION	TRACK:	TRACK 01: IMAGING
SESSION	NAME:	SP150 – X-RAY PHASE CONTRAST & SCATTER Imaging
SESSION	CHAIR(S)	E PAUL JOHNS, CANADA Rhiannon Murrie, Australia
17:00	scatter	 Reducing signal extraction artefacts for x-ray imaging with multiple pencil beams hns, Canada
17:15	of the lu and lab	2 - Live animal phase contrast x-ray velocimetry ings: Optimising imaging speed for synchrotron source imaging on Murrie, Australia
17:30	mammo synchro	3 - X-ray Phase-Contrast imaging: from ography to breast tomography using otron radiation <i>Longo, Italy</i>
17:45	at BMIT	4 - 4 Years of X-ray Imaging at 05B1-1 Beamline - z Wysokinski, Canada
18:00	monoch	5 - An energy dispersive bent Laue nromator for K-edge subtraction imaging n Samadi, Canada
18:15	contras sensitiv	6 - An incoherent implementation of x-ray phase t imaging and tomography that maintains high ity at low delivered doses ndro Olivo, United Kingdom
18:30	size usi	7 - Indirect measurement of average alveolar ng dynamic phase-contrast imaging Jes Martinson, Canada
SESSION	TIME:	17:00 – 19:00
SESSION	ROOM:	714B
SESSION	TRACK:	TRACK 03: BIOMECHANICS AND ARTIFICIAL ORGANS
SESSION	NAME:	SP151 – CARDIO MECHANICS & ORGANS
		: DAVID MACKU, CZECH REPUBLIC

- 17:00 SP151.1 KEYNOTE: Biomechanics and artificial organs Birgit Glasmacher, Germany
- 17:30 SP151.2 The Continuous Flow Total Artificial Heart in Clinical Practice David Macku, Czech Republic
- 17:45 SP151.3 Power Control Range of Operation for the Left Ventricular Assist Device in Bridge-to-Recovery Treatment *Marwan Simaan, United States*

- 18:00 SP151.4 An quantitative estimation method of peripheral perfusion by using a CCD camera during rotary blood pump support Yasuyuki Shiraishi, Japan
- 18:15 SP151.5 Mathematical Modeling of Left Ventricle Stroke Work Following Transcatheter Aortic Valve Replacement Associated With Paravalvular Leaks *Azadeh Saeedi, Canada*
- 18:30 SP151.6 Criteria to study Heart Failure derived from ESPVR *Rachad Shoucri, Canada*
- 18:45 SP151.7 Fluid Dynamics of Transcatheter Aortic Valve Associated with Paravalvular Leak *Azadeh Saeedi, Canada*

SESSION TRACK:	TRACK 04: RADIATION ONCOLOGY
SESSION NAME:	SP153 – QUALITY ASSURANCE: PART 4
SESSION CHAIR(S): YOUNG LEE, CANADA DAVID THWAITES, AUSTRALIA

- 17:00 SP153.1 Comparison of AAA and CCC Algorithms for H&N RapidArc pre-patient treatment QA *Thuso Ramaloko, South Africa*
- 17:15 SP153.2 Tuning treatment planning system model parameters for accurate VMAT dose calculation using conformal arc plans Orest Ostapiak, Canada
- 17:30 SP153.3 Prostate brachytherapy with Oncentra Seeds: Intra-operative planning and delivery software validation assisted by an FMEA *Renee Larouche, Canada*
- 17:45 SP153.4 Investigation of predictive parameters for pre-treatment measurement pass rates in hypofractionated volumetric arc therapy (HF-VMAT) plans of single brain metastasis Young Lee, Canada
- **18:00** SP153.5 Inter-centre comparison of dose delivery accuracy for six different linac-planning system combinations for SBRT lung cancer treatment using FFF beams.

David Thwaites, Australia

- 18:15 SP153.6 A pilot study investigating the impact of treatment delivery uncertainties for lung SABR using step and shoot IMRT and VMAT David Thwaites, Australia
- 18:30 SP153.7 Adaptive patient dose assessment using daily 3D cone beam CTs and Monte Carlo simulations *Nevin McVicar, Canada*

SESSION TIME:	17:00 – 18:00
SESSION ROOM:	716A
SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP154 – DEVELOPMENTS IN RADIATION PROTECTION
SESSION CHAIR(S): STEPHEN SAWCHUK, CANADA

- 17:00 SP154.1 Out-of-field radiation dose to critical organs due to radiotherapy for testicular seminoma with modified dog-leg fields: is there a risk for stochastic effects? *Michalis Mazonakis, Greece*
- 17:15 SP154.2 Peripheral photon dose in organs Beatriz Sanchez Nieto, Chile

- 17:30 SP154.3 Gamma Radiation Dose-Response Relationship of Human Thyroid Follicular Cells Shyamal Chakraborty, Bangladesh
- 17:45 SP154.5 Aligning the ALARA principle with FFF treatment modalities *Stephen Sawchuk, Canada*

SESSION TIME:	17:00 – 19:00
SESSION ROOM:	715B
SESSION TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
SESSION NAME:	SP155 – CHARACTERIZATION OF DETECTOR SYSTEMS FOR THERAPY DOSIMETRY: PART 3
SESSION CHAIR(S): DIANA ADLIENE, LITHUANIA

- 17:00 SP155.1 Ferrous methylthymol blue gelatin gel dosimter with improved auto-oxidation stability *Kalin Penev, Canada*
- 17:15 SP155.2 The dosimetric property of TLD2000 thermoluminescent dosimeter Nan Zhao, People's Republic of China
- 17:30 SP155.3 Application of 2D thermoluminescent dosimetry in QA test of Cyberknife *Renata Kopec, Poland*
- 17:45 SP155.4 Towards Optical CT scanning of radiochromic 3D dosimeters in mismatched refractive index solutions *Kurtis Dekker, Canada*
- 18:00 SP155.5 Development of a Novel Linear Energy Transfer Detector Using Doped Plastic Scintillators and Monte Carlo Simulation *Humza Nusrat, Canada*
- 18:15 SP155.6 Reduction of residual signal in LiF:Mg, Cu, P thermoluminescent material.
 Vinod Nelson, Australia
- 18:30 SP155.7 Application of dose gels in HDR brachytherapy Diana Adliene, Lithuania
- 18:45 SP155.8 Practical 3D QA for Radiation Therapy Based on High-Resolution Laser CT of Reusable Radiochromic Polymer-Gel Dosimeters in Dedicated Phantoms Stephen Avery, United States

SESSION	TIME:	17:00 – 18:45	
SESSION	ROOM:	715A	
SESSION	TRACK:	TRACK 07: SURGERY, COMPUTER AIDED SURGERY, MINIMAL INVASIVE INTERVENTIONS ENDOSCOPY AND IMAGE-GUIDED THERAPY, MODELLING AND SIMULATION	
SESSION	NAME:	SP156 – PATIENT-SPECIFIC MODELING AND SIMULATION IN SURGERY	
SESSION	CHAIR(S): KLAUS RADEMACHER, GERMANY JIN LONG LIU, PEOPLE'S REPUBLIC OF CHINA	
17:00	Finite E	1 - A Technique for Prostate Registration by lement Modeling en Cui, Singapore	
17:15	switch	2 - Modeling study of neo-aortic root for arteria operation: a structural finite element analysis ong Gu, People's Republic of China	
17:30	SP156.3 - Preoperative in silico analysis of atherosclerotic calcification vulnerability in carotid artery stenting using Finite Element Analysis by considering Agatston score Sadegh Riyahi Alam, Italy		
17:45		4 - Biomechanical modeling for foot inversion ao Guo, People's Republic of China	
18:00	female	5 - Deformation Method and 3D Modeling of th body to simulate Core Biopsy procedure as Brasil, Brazil	
18:15	of Pulm specific	6 - Effects of Band Position on Hemodynamics nonary Artery: A Numerical Study of Patient- c Virtual Procedure ng Liu, People's Republic of China	
18:30	Model o Diaphra	7 - Experimentally validated Biomechanical of in vivo Lung under EBRT considering agm motion hysteresis <i>Karami, Canada</i>	
SESSION	TIME:	17:00 – 18:15	
SESSION	ROOM:	717B	
SESSION	TRACK:	TRACK 08: BIOSENSOR, NANOTECHNOLOGY, BIOMEMS AND BIOPHOTONICS	
SESSION	NAME:	SP157 – BIOCHIPS AND BLOOD ANALYSIS	
SESSION	CHAIR(S): JONATHAN LOVELL, UNITED STATES	
17:00	SP157.1	I - KEYNOTE: On-chip blood Plasma	

- **17:00** SP157.1 **KEYNOTE:** On-chip blood Plasma separation using vacuum-assisted micropumping for point-of-care application *Kwang Oh, United States*
- **17:30** SP157.2 Multi-Functional Platform for Blood Group Phenotyping using Surface Plasmon Resonance *Whui Lyn Then, Australia*

17:45 SP157.3 - Harmonic generation microscopy investigation of human pathological samples for automated cancer determination *Richard Cisek, Canada*

18:00 SP157.4 - Protein Patterning: An investigation on the use of different protein deposition techniques and parameters to transfer proteins onto various surfaces. *Kathryn Clancy, Canada*

A	SESSION		717A
	SESSION	TRACK:	TRACK 17: EDUCATIONAL AND PROFESSIONAL ACTIVITIES
ial	SESSION	NAME:	SP158 – EDUCATIONAL ACTIVITIES AND TRAINING IN MEDICAL PHYSICS
a	SESSION	CHAIR(S)	: ANCHALI KRISANACHINDA, THAILAND John Damilakis, greece
	17:00	What's,	- Medical Physics Residencies-101: The Where's, and How's neth, Canada
	17:15	Physics	2 - Education and Clinical Training of Medical in Thailand i Krisanachinda, Thailand
he	17:30	Radiatic	B - Radiation Protection in Medical Imaging and on Oncology lena Stoeva, Bulgaria
S	17:45	Official Medical	4 - It's a Medical Physics World! Presenting the Bulletin of the International Organization for Physics I ena Stoeva, Bulgaria
	18:00	Medical	5 - The new IOMP Professional Journal - Physics International - first results Tabakov, United Kingdom
i	18:15	and Dis Undergi	6 - Two First Years of Reuniting, Engaging covering: The Canadian Congress for raduate Women in Physics n Rilling, Canada
I	18:30	Heidelb	⁷ - Students' perspective on studying online at erg University, Germany (UHD) Schaefer, Germany
l	18:45	Physics	3 - Launching of the ASEAN College of Medical loong Ng, Malaysia

SESSION TIME:	17:00 – 18:15
SESSION ROOM:	716B
SESSION TRACK:	TRACK 19: BIOPHYSICS AND MODELLING
SESSION NAME:	SP159 – TRANSPORT AND PHYSIOLOGICAL MODELLING
SESSION CHAIR(S): CHAI HONG YEONG, MALAYSIA

- 17:00 SP159.1 KEYNOTE: Dwarfing Big Data for Oncology Applications: Necessity and Possibilities Issam El Naga, Canada
- 17:30 SP159.2 Improved temperature monitoring and treatment planning for loco-regional hyperthermia treatments of Non-Muscle Invasive Bladder Cancer (NMIBC)

Gerben Schooneveldt, Netherlands

- 17:45 SP159.3 A Full 3D CFD Model Coupled with an Outflow Lumped Boundary and Inflow Total Pressure Formulation to Estimate Human Cardiac Perfusion *Iyad Fayssal, Lebanon*
- 18:00 SP159.4 Simulation Model of Image-Guided Percutaneous Thermal Ablation in the Assessment of Optimal Approach for Complete Tumour Ablation *Chai Hong Yeong, Malaysia*

SESSION TIME:	17:00 – 18:15
SESSION ROOM:	713B
SESSION TRACK:	PRESIDENT'S CALL
SESSION NAME:	SP160 – NEUROENGINEERING, NEURAL SYSTEMS / BIOPHYSICS AND MODELLIN
SESSION CHAIR(S): VENKATESHWARLA RAJU. INDIA

SESSION CHAIR(S): VENKATESHWARLA RAJU, INDIA TEODORO CORDOVA - FRAGA, MEXICO

NG

- 17:00 SP160.1 From 'Fracking' and 'Macrovoids' to the Onset of Cancer Metastasis: A Mechano-Metabolomics Model of a Plausible Fluid-Solid Network Instability in Tumors Sai Prakash, United States
- 17:15 SP160.2 Surface electromyography in quantifying Parkinson's disease and its treatment with deep brain stimulation Pasi Karjalainen, Finlandia
- 17:30 SP160.3 A Decade of Experience with Intraoperative Microelectrode Recording in Determining the Subthalamic Nuclie (STN) Deep Brain Stimulation? Lead Positions in 260 Parkinson Diseased Conditions in South India? A Retrospective Study Venkateshwarla Raju, India
- 17:45 SP160.4 Vortex of the Magnetic Field on the Growth Rate of Escherichia Coli Teodoro Cordova - Fraga, Mexico
- 18:00 SP160.5 Electro Magnetic Therapy and Laser in the Chronic Pain Of The Woman *Manuel Zuniga, Ecuador*

SCIENTIFIC PROGRAM

SCIENTIFIC PROGRAM **BY DAY**

▶ Friday, June 12 2015

Friday, June 12 2015

	SESSION	TIME:	08:00 - 09:45			Jessic	a Kishimoto, Canada
	SESSION	ROOM:			08:30		.3 - Endoleak and Thrombus Characterization
	SESSION	TRACK:	TRACK 01: IMAGING			Emboli	ynamic Elastography after Endoleak ization following Aneurysm Endovascular Repa
	SESSION	NAME:	SP161 – ANGIOGRAP	HY / X-RAY IMAGING	aa 45	-	y Bertrand-Grenier, Canada
SCIEN	SESSION	CHAIR(S): JOSÉ CARLOS DE I JEFF FRIMETH, CA		08:45	handhe	.4 - Detecting lipid-rich artery plaque using a eld photoacoustic imaging device nu Hirano, Japan
TIFIC					09:00		.5 - Intersex differences in posterior eye chamb
	08:00		1 - 5D DSA Using Dua Shaughnessy, United			by spe Zofia I	ctral optical coherent tomography Drzazga, Poland
SCIENTIFIC PROGRAM	08:15	Micros		enium-Doped t Agents for Diagnostic	09:15	Neona	.6 - Longitudinal Analysis of 3D Pre-Term tal Ventricle Ultrasound Images <i>u, Canada</i>
		X-Ray I José C	tarlos De La Vega, Ca	anada	09:30		.7 - Breast Invasive Ductal Carcinoma Assesse
	08:45	of imag		perimental comparison dual-energy subtraction		Ultrasc	nventional Ultrasound and Contrast-Enhanced bund in Different T-Stages <i>un Zhu, People's Republic of China</i>
			ane Burton, Canada		09:45		8 - Comparison of ultrasound systems in
	09:00	Influen Signific		t of Precision Error, Least e Mineral Density in Dual-			sis measurement e Hess, Canada
			imeth, Canada	,			
	Estima		P161.5 - Use of Conventional Regional DXA Scans for stimating Whole Body Composition ohammad Reza Salamat, Iran	SESSION		08:00 - 10:00	
				SESSION			
	09:30		6 - Multiple Energy Sy g System? Preliminary	nchrotron Biomedical / Results	SESSION	TRACK:	TRACK 05: DOSIMETRY AND RADIATION PROTECTION
		Bassey	Bassey, Canada		SESSION	NAME:	SP163 – PRIMARY DOSIMETRY STANDARDS
	-		_	_	SESSION	CHAIR(S	S): NATALKA SUCHOWERSKA, AUSTRALIA RONALD TOSH, UNITED STATES
	SESSION	TIME:	08:00 - 10:00			0.0.4.0.0	
	SESSION	ROOM:	701B		08:00	Next-G	.1 - KEYNOTE: Candidate Technologies for Generation Dosimetry Standards
	SESSION	TRACK:	TRACK 01: IMAGING				d Tosh, United States
	SESSION	NAME:		O AND OCT: APPLICATIONS	08:30		.2 - Absorbed dose to water measurements in I carbon ion beam using water calorimetry
	SESSION	CHAIR(S): DAVID GOERTZ, CA WU QIU, CANADA	ANADA		Julia-I	Maria Osinga, Germany
	08:00	SD160		ound Piomiorecents for	08:45	BIPM.F	.3 - Results from the on-going key comparison RI(I)-K6 : What have we learned? ne Picard, France
	08:00		detection of caustic es	sound Biomicroscopy for sophagitis in rats	09:00	SP163	.4 - Absorbed dose-to-water primary standard

08:15 SP162.2 - To tap or not to tap: A comparison of cranial 3D to 2D ultrasound in extremely preterm neonates with post-hemorrhagic ventricle dilation to predict the necessity of interventional ventricular tap o, Canada

- dinal Analysis of 3D Pre-Term Ultrasound Images
- nvasive Ductal Carcinoma Assessed Iltrasound and Contrast-Enhanced erent T-Stages ople's Republic of China

		Nonaiu Tosh, Onneu States
OCT: APPLICATIONS A	08:30	SP163.2 - Absorbed dose to water measurements in a clinical carbon ion beam using water calorimetry <i>Julia-Maria Osinga, Germany</i>
Biomicroscopy for	08:45	SP163.3 - Results from the on-going key comparison BIPM.RI(I)-K6 : What have we learned? <i>Susanne Picard, France</i>
agitis in rats	09:00	SP163.4 - Absorbed dose-to-water primary standard and traceability system for radiotherapy in China <i>Kun Wang, People's Republic of China</i>

João Machado, Brazil

- 09:30 SP163.5 Design of an MRI-compatible water calorimeter for use in an integrated MRI-Linac and Gamma-Knife *Niloufar Entezari, Canada*
- 09:45 SP163.6 On the practical use of calorimetry for routine absolute dosimetry in the radiotherapy clinic *James Renaud, Canada*

SESSION TIME:	08	:00 – 09:45
SESSION ROOM:	71	BB
SESSION TRACK:		ACK 06: NEW TECHNOLOGIES IN CANCER SEARCH AND TREATMENT
SESSION NAME:	SP	164 – ADAPTIVE RADIATION THERAPY (ART
SESSION CHAIR(S)		EVA BEZAK, AUSTRALIA DANIEL TAMAGI, CANADA

- 08:00 SP164.1 Real-time dose reconstruction for adaptive radiation therapy Martin Fast, United Kingdom
- 08:15 SP164.2 Evaluation of unified intensity-modulated arc therapy (UIMAT) for the treatment of head-and-neck cancer *Michael Macfarlane, Canada*
- 08:30 SP164.3 A Hybrid IMRT/VMAT Technique for the Treatment of Nasopharyngeal Cancer Nan Zhao, People's Republic of China
- 08:45 SP164.4 Interactive real time adaptation of IMRT treatment plans Cornelis Philippus Kamerling, United Kingdom
- 09:00 SP164.5 A Hybrid IMRT/VMAT technique for the treatment of non-small cell lung cancer Nan Zhao, People's Republic of China
- 09:15 SP164.6 Offline adaptive VMAT feasibility study using planning CT deformed electron density mapping on daily CBCT to estimate parotid dose volume relationship Vellian Subramani, India
- 09:30 SP164.7 Plan Optimization for a Lung Patient on a Parallel Linac-MR System Daniel Tamagi, Canada

SESSION ROOM: 716B

SESSION TRACK: TRACK 09: BIOSIGNAL PROCESSING

SESSION NAME: SP165 - EEG

- SESSION CHAIR(S): JENS HAUEISEN, GERMANY TEODIANO BASTOS-FILHO, BRAZIL
- 08:00 SP165.1 A Fully Unsupervised Clustering on Adaptively Segmented Long-term EEG Data Vaclav Gerla, Czech Republic

08:15 SP165.2 - A Real-Time Clustered MUSIC algorithm for the localization of synchronous MEG/EEG source activity

Daniel Baumgarten, Germany

- 08:30 SP165.3 Spatial harmonics for compressive sensing in electroencephalography Jens Haueisen, Germany
- 08:45 SP165.4 An Evaluation of Performance for an Independent SSVEP-BCI Based on Compression Sensing System Teodiano Bastos-Filho, Brazil
- 09:00 SP165.5 Multi-way based Source Localization of Multichannel EEG signals Exploiting Hilbert-Huang Transform Saeed Pouryazdian, Canada

SESSION TIME:	08:00 – 10:00
SESSION ROOM:	714B
SESSION TRACK:	TRACK 11: NEUROENGINEERING, NEURAL Systems
SESSION NAME:	SP166 – NEUROPROSTHESES
SESSION CHAIR(S): PAUL YOO, CANADA

- 08:00 SP166.1 Enhanced Transcutaneous Electrical Nerve Stimulation (eTENS): A Novel Method of Achieving Posterior Tibial Nerve Stimulation Therapy for Overactive Bladder Paul Yoo, Canada
- 08:15 SP166.2 Decreasing Upper Extremity Demands During Sitting Pivot Transfers for Individuals with Spinal Cord Injury by Utilizing Functional Electrical Stimulation Stephanie Bailey, United States
- 08:30 SP166.3 Design of Orthotic Mechanisms to Control Stand-to-Sit Maneuver for Individuals with Paraplegia *Ronald Triolo, United States*
- 08:45 SP166.4 Improved Peripheral Nerve Recording with a Small Form-Factor Nerve Cuff Electrode: A Computational Study *Parisa Sabetian, Canada*
- 09:00 SP166.5 Effect of stimulation on non-erect postures with a standing neuroprosthesis Brooke Odle, United States
- 09:15 SP166.6 Automatic Detection of Destabilizing Wheelchair Conditions for Modulating Actions of Neuroprostheses to Maintain Seated Posture *Ronald Triolo, United States*
- 09:30 SP166.7 Selecting Upper Extremity Command Signals to Modulate Electrical Stimulation of Trunk Muscles during Manual Wheelchair Propulsion Stephanie Bailey, United States

SESSION	TIME:	08:00 – 10:00
SESSION	ROOM:	715B
SESSION	TRACK:	TRACK 12: MEDICAL DEVICES
SESSION	NAME:	SP167 – GI AND GU
SESSION	CHAIR(S)	: FRANCO SIMINI, URUGUAY PHILIPPA MAKOBORE, UGANDA
08:00		- KEYNOTE: Medical Devices Fenster, Canada
08:30	Mellitus and 50 (P - Dielectric Properties of Urine for Diabetes and Chronic Kidney Disease between 0.2 GHz GHz ng Ting, Malaysia
08:45	Measur Clampir	 Intraoperative Bioelectrical Impedance ement for Assisting Segmental Renal Artery ng Partial Nephrectomy People's Republic of China
09:00	Parallel Follow-u	- Renal Volume Estimation by Ultrasound Scanning for Polycystic Kidney Disease Jp Simini, Uruguay
09:15	Retentio Measur	 Can Removal of Middle Molecular Uremic on Solutes be Estimated by UV-absorbance ements in Spent Dialysate? ri, Estonia
09:30	combina resonar	 Discrimination of prostate tissue with a ation of Raman spectroscopy and tactile ace technology Indahl, Sweden
09:45	Resource Feed Int	- Appropriate Medical Devices for Low ce Settings: Electronically Controlled Gravity- travenous Infusion Set a Makobore, Uganda
SESSION	TIME:	08:00 – 09:45
SESSION	R00M:	717В
SESSION	TRACK:	TRACK 12: MEDICAL DEVICES
SESSION	NAME:	SP168 – HEALTH CHALLENGES IN RESOURCE-POOR NATIONS
SESSION	CHAIR(S)	: MLADEN POLUTA, SOUTH AFRICA KARIM S KARIM, CANADA
08:00		- KEYNOTE: Medical Devices Velazquez Berumen, Switzerland
08:30	technolo framewo	2 - Challenges of introducing health ogies to low resource settings in global ork: a case study at WHO g, Switzerland

SP168.3 - Portable microwave based stroke and 08:45 trauma diagnostics Mikael Persson, Sweden

FRIDAY JUNE 12 2015

- 9:30 08:00 08:30 08:45 09:00 09:15
- 09:00 SP168.4 - Bending the cost curve: Towards a \$1000 diagnostic X-ray imager for scalable and sustainable healthcare Karim S Karim, Canada
- 09:15 SP168.5 - Creating a Continental Network of Healthcare Innovation Centers: Collaborating across National Boundaries to design Devices and Best Practices Fred Hosea, United States
 - SP168.6 Towards a WHO List of Priority Medical Devices for Cancer Care, targeting low and middle income countries Miriam Mikhail Lette, Switzerland

SESSION TIME:	08:00 – 09:45
SESSION ROOM:	701A
SESSION TRACK:	TRACK 13: INFORMATICS IN HEALTH CARE AND PUBLIC HEALTH
SESSION NAME:	SP169 – SELF ENGAGEMENT, PATIENT EMPOWERMENT AND MHEALTH
SESSION CHAIR(S): GIUSEPPE FICO, SPAIN ELENI KALDOUDI, GREECE

- SP169.1 KEYNOTE: Empowering patients through information technologies Eleni Kaldoudi, Greece
- SP169.2 Distributed learning: developing a predictive model for dyspnea in lung cancer patients based on data from multiple hospitals Johan Van Soest, Netherlands
- SP169.3 User Centered Design to incorporate predictive models for Type 2 Diabetes screening and management into professional decision support tools: preliminary results. Giuseppe Fico, Spain
- SP169.4 Quantifying Bipolar Disorder for Technology-Assisted Self-Management James Amor, United Kingdom
- SP169.5 Hippocratic Protocol Design to Improve Security and Privacy in Healthcare Applications for NFC Smartphone Jose Pirrone Puma, Venezuela
- 09:30 SP169.6 - Extracting Intention from Web Queries? Application in eHealth Personalization George Drosatos, Greece

SESSION TIME:	08:00 - 09:30
SESSION ROOM:	715A
SESSION TRACK:	TRACK 14: INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT
SESSION NAME:	SP170 – INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT: PART 3
SESSION CHAIR(S): BRUCE CURRAN, UNITED STATES JOSEPH CAFAZZO, CANADA

- 08:00 SP170.1 Wireless equipment localization for medical environments Daniel Lagua, Germany
- 08:15 SP170.2 Exploring Approaches to Optimise the Estimation of Preterm Birth Using Machine Learning Techniques Monique Frize, Canada
- 08:30 SP170.3 Smartwatch App as the Chest Compression Depth Feedback Device Yujin Jeong, Republic of Korea
- 08:45 SP170.4 Diagnosis of the corporal movement in Parkinson's Disease using Kinect Sensors Jose Pirrone Puma, Venezuela
- 09:00 SP170.5 A System to Support Regional Screening Programs to Identify School-age Children at Risk of Neurodevelopmental Disorders Elsa Santos Febles, Cuba
- 09:15 SP170.6 Support plataform to decision making in research and technological development in public health: a brazilian scenario approach *Carlos Rocha, Brazil*
- SESSION TIME: 08:00 10:00

SESSION	ROOM:	714A
---------	-------	------

SESSION TRACK: PRESIDENT'S CALL

- SESSION NAME: SP171 CLINICAL ENGINEERING / PHYSICS, PATIENT SAFETY & IMAGING
- SESSION CHAIR(S): GORDON CHAN, CANADA VICTOR MALVAEZ, MEXICO
- 08:00 SP171.1 Properties Evaluation of Gd2O3-DEG as New Contrast Agent Nanomagnetic Particles Comparing to Gd-DTPA in MRI Nader Riahi-Alam, Iran
- 08:15 SP171.2 Imaging the Schlemm's Canal using an ultrahigh resolution spectral-domain optical coherence tomography working at 1.3 micrometer center wavelength *Masreshaw Bayleyegn, Ethiopia*
- 08:30 SP171.3 Technology Trayectory Hybrid Tomography by Positron Emissions *Victor Malvaez, Mexico*

08:45 SP171.4 - Myocardial perfusion imaging by low-dose CT

Sabee Molloi, United States

- 09:00 SP171.5 Renal Dynamic Phantom for Use in SPECT Divanizia Souza, Brazil
- 09:15 SP171.6 Physics Plan Checking Practices Gordon Chan, Canada
- 09:30 SP171.7 Commissioning of a Flattening Filter Free Satya Ranjan Saha, Bangladesh
- 09:45 SP171.8 Effects of 24 hour Wakefulness on Tilt Based Targeting Tasks Jeffrey Bolkhovsky, United States

SESSION TIME:	10:30 - 12:00
SESSION ROOM:	718A
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP172 – MAMMOGRAPHY AND Tomosynthesis
SESSION CHAIR(S): ALESSANDRA TOMAL, BRAZIL KWAN HOONG NG, MALAYSIA

- 10:30 SP172.1 KEYNOTE: Evaluation of automatic exposure control in digital mammography Alessandra Tomal, Brazil
- **11:00** SP172.2 Comparing the use of force-standardized and pressure-standardized mammographic compression protocols in an Asian context *Kwan Hoong Ng, Malaysia*
- **11:15** SP172.3 Radiation dose of step-and-shoot digital breast tomosynthesis using an anti-scatter grid compared to full field digital mammography in a clinical population *Cecile Jeukens, Netherlands*
- 11:45 SP172.4 Absorbed dose in PMMA and Equivalent Breast Phantom in a Digital Breast Tomosynthesis system: Monte Carlo Assessment *Luis Magalh*ães, *Brazil*

SESSION TIME:	10:30 – 11:45
SESSION ROOM:	701B
SESSION TRACK:	TRACK 01: IMAGING
SESSION NAME:	SP173 – ULTRASOUND AND OCT: METHODS
SESSION CHAIR(S): BORNA MARAGHECHI, CANADA WILLIAM HRINIVICH, CANADA

10:30 SP173.1 - A comparision study on shear wave velocity estimation of thin layered media using shear wave imaging Jun Keun Jang, Japan

 10:45 SP173.2 - Temperature Dependence of Norlinear Accuracy of Section 11:00 SP173.3 - 3D trans-rectal ultrasound for high-dose-rate prostate brachytherapy, normaliced large volume set has agitally-assisted axial image sets William Hinkinkch, Canada 11:00 SP173.3 - Understanding lung ultrasound artifacts using phanom number of Section 11:00 SP173.5 - Accuracy of Tissue Elasticity Measurement using shardwave Unamous Visuance Elasticity Measurement using shardwave Unamous Visuance Elasticity Measurement using Shard William Models Christian Cuthler, Cernany 11:30 SP173.5 - Accuracy of Tissue Elasticity Measurement using Shard Wave Unamous Charles States 11:50 SP174.5 - Moestianding lung ultrasound Elasticity Measurement using Shard Wave Unamous Charles Christian Cuthler, Cernany Bindatt Paliwai, United States 11:50 SP174.5 - Moestianding Ling ultrasound Elasticity Measurement in BrueBeam Advance Pathema Phanom Study Charl Morging deep Instead Charles States 11:50 SP174.1 - Assessment of lung dose in patients undergoing deep Institution Of College Station Path Lonski, Australia 11:50 SP174.1 - Assessment of lung dose in patients undergoing deep Institution of AD Cost and Accuracy of Path Lonski, Australia 11:50 SP174.1 - Assessment of lung dose in patients undergoing deep Institution of AD Cost and Accuracy of AD Cost and Accuracy of AD Cost and Accuracy and Acchronic Accuracy of AD Cost and Accuracy and Accu								
 SP173.3 - 3D trans-rectal ultrasound for high-dose-rate prostate brachytherapy, recomparison of sagittally-reconstructed 3D mage volumes with sagittally-assisted axid image sets. Multiam Hrinivich, Canada SP173.3 - Understanding lung ultrasound artifacts using a phanom lung model <i>Justine Shuhul Loh, United Kingdom</i> SP173.5 - Couracy of Tissue Elasticity Measurement using Shard Wale Ultrasound Elastography: A Comparative Phantom Study Chai Hong Yeong, Malaysia SP555.1 Investigation of Dosimetric and Biolog Differences between Flattened and Unflattened from the TrueBeam System Bhudett Palwal, United States SESSION TIME: 10:30 - 11:45 SESSION TIME: 10:30 - 11:45 SESSION TRACK: TRACK 04: RADIATION ONCOLOGY SESSION TRACK: TRACK 04: RADIATION ONCOLOGY SESSION TRACK: Australia SP174.1 - Assessment of lung dose in patients undergoing deep inspiration breath hold for left sided breast cancer Pata Lonski, Australia SP174.2 - Evaluation of ADPOS System for Dose and Patametis in IMRT/WAIT Beams Targy Keim, Justical Science (Justice), Canada SP174.3 - Apolication of ADPOS System for Dose and Patametis in IMRT/WAIT Beams Targy Keim, Justical Science (Justice), Canada SP174.3 - Apolication of ADPOS System for Dose masteris in IMRT/WAIT Beams Targy Keim, Justical Science (Justice), Canada SP175.4 - Evaluation of the probabilistic reatment margin for two targets with correlated motion Marcel Van Herk, Netherlands SP175.4 - Track Van Facht Van Pata ID One Chains SP175.4 - Deviction of the probabilistic reatment margin for two targets with correlated motion Marcel Van Herk, Netherlands SP175.4 - Subtability of Doordes for Point Dose Massurement in IMRT/WAIT Beams Targy Hirrok Tanaka, Japan SP175.4 - Subtability of Doordes for Point Dose Massurement in IMRT/WAIT Beams Targy (Justice) States	10:45	Acoustic Harmonics in Water: Measu Simulation		10:45	radioth therapy	erapy combine / in the treatme	d plus volumetric nt of non-small c	modulated ar

PAULO COSTA, BRAZIL

10:30 SP175.1 - Adaptive radiotherapy for bladder cancer using deformable image registration of empty and full bladder *Prabhjot Juneja, Australia*

FRIDAY JUNE 12 2015

- 10:30 SP177.1 - Simple expression of x-ray doses below 1 MeV grazing incident on shields of concrete and iron backed by lead Nobuteru Nariyama, Japan
- 10:45 SP177.2 - Evaluation of conversion coefficients from Air Kerma to Ambient Dose Equivalent for secondary barriers in diagnostic radiological facilities Paulo Costa, Brazil
- 11:00 SP177.3 - Shielding photon beams to account for adjacent, underground building of a radiation therapy facility Dario Sanz, Argentina
- 11:15 SP177.4 - Vectorization of the time-dependent Boltzmann transport equation for photon beams: applications in radiation shielding Dario Sanz, Argentina
- 11:30 SP177.5 - The use of FLUKA Monte Code in the redesign of radiotherapy mazes with the use of lead cladding of a few mm thickness Ihsan Al-Affan, United Kingdom

SESSION TIME:	10:30 – 12:15
SESSION ROOM:	714B
SESSION TRACK:	TRACK 11: NEUROENGINEERING, NEURAL Systems
SESSION NAME:	SP178 – NEUROIMAGING, NEURONAVIGATIO AND NEUROLOGICAL DISORDERS

- SESSION CHAIR(S): TAUFIK VALINATE, CANADA
- 10:30 SP178.1 - Characterization of Single Units in Human Neocortical Slices Maintained In Vitro Sara Mahallati, Canada
- 10:45 SP178.2 - Astrocytes enhance neuronal long term potentiation in a biophysical model of epilepsy Vasily Grigorovsky, Canada
- 11:00 SP178.3 - Influence of the 'sympathetic slump' on biomechanics of the sympathetic trunk Liesbeth Van Hauwermeiren, Belgium
- 11:15 SP178.4 - Superparamagnetic Nanoparticles for **Epilepsy Detection** Ebrahim Ghafar-Zadeh, Canada
- 11:30 SP178.5 - Automatic detection of epileptic seizures in scalp EEG Yasser Pérez, Cuba
- 11:45 SP178.6 - Beta/Theta Neurofeedback Training Effects in Physical Balance of Healthy People Wenya Nan, People's Republic of China
- 12:00 SP178.7 - Potential Benefits in Comparing the Neural Control Networks Studies Between the Oculomotor and Cardiac Pacing Systems Michael Cheng, Canada

SESSION TIME:	10:30 – 11:30
SESSION ROOM:	715B
SESSION TRACK:	TRACK 12: MEDICAL DEVICES
SESSION NAME:	SP179 – MEDICAL DEVICES: MISCELLANEOUS
SESSION CHAIR(S): KLAUS RADERMACHER, GERMANY

- 10:30 SP179.1 - Acceptance Test of the first Hospital Cyclotron for Production of PET tracers in Iran Pardis Ghafarian, Iran
- 10:45 SP179.2 - HiFEM - An Integrated Approach for Human Centered Risk Management for Medical Devices Klaus Radermacher, Germany
- 11:00 SP179.3 - Ultrasonic Microscanning for Digital Dental Impressioning Klaus Radermacher, Germany
- 11:15 SP179.4 - A study on prefrontal blood flow in patients with moderate dementia and severe dementia using near -infraredinfrared Shingo Takahashi, Japan

SESSION TIME:	10:30 – 11:30
SESSION ROOM:	715A
SESSION TRACK:	TRACK 14: INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT
SESSION NAME:	SP180 – INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT: PART 4
SESSION CHAIR(S): BRUCE CURRAN, UNITED STATES Joseph Cafazzo. Canada

10:30 SP180.1 - Increasing efficiency of data transfer in WBANs Luka Celic, Croatia

SP180.2 - Decision support system for no common 10:45 emergency in a big city with intelligent routing algorithm and attention quality parameters evaluation. Lupe Toscano, Peru

- SP180.3 Development of a Multi-Center Clinical Trial 11:00 Data Archiving and Analysis Platform Brandon Driscoll, Canada
- 11:15 SP180.4 - Global Health Catalyst: A systematic Spacetime compression platform for catalyzing global health collaborations in Radiation Oncology Wilfred Ngwa, United States

POSTERS

The IUPESM 2015 Posters will be displayed in the Exhibit Hall during open hours.

Presenting Author Stand By Time:

Presenters are request to stand by their posters during the networking breaks scheduled 10:00 - 10:30 and 16:30 - 17:00 Monday, June 8 to Thursday, June 11.

PS01 - TRACK 01: IMAGING

PS01.001 – A discontinuity artefact at the isocenter of on-board CBCT images

Elsayed Ali, Canada

PS01.002 - Correction of Metal Artefacts Induced from Pacemaker and ICD Leads in CT-Based **Attenuation Correction of Cardiac** SPECT data

Mohammad Reza Ay, Iran

PS01.003 – Anthropomorphic Phantom of the Pancreas for Scintillation **Camera Tests**

Lourdes Brasil, Brazil

PS01.004 - Comparing two image processing techniques, Wavelet and Segmentation by threshold, for detecting microcalcifications in an image mammographic.

Lourdes Brasil, Brazil

PS01.005 – Measuring red blood cell velocity in capillary using video and image processing

Surapong Chatpun, Thailand

PS01.006 – Development of a **Quantitative PET QA Procedure for Multi-Center Clinical Trials**

Brandon Driscoll, Canada

PS01.007 - Unwrapping highly wrapped phase using Nonlinear Multi-Echo phase unwrapping

Chemseddine Fatnassi, Switzerland

PS01.008 – Investigation of optimal display size for viewing MRI images using a digital contrast-detail phantom

Hideki Fujita, Japan

PS01.009 - Investigation of presampled MTF using a slit device with slightly wider aperture

Rumi Gotanda, Japan

PS01.010 – 3D Tumor delineation in Positron Emission Tomography reconstructed images restored by the use of Lucy Richardson blind deconvolution method

Albert Guvenis, Turkey

PS01.011 - Different options for stimulation intensity in mapping cortical motor area in navigated transcranial magnetic stimulation

Petro Julkunen, Finland

PS01.012 – Software Breast Phantom for Phase Contrast Imaging Applications Nicolas Pallikarakis. Greece

PS01.013 – Actions for Implementation Program of Image Quality of Mammography

Ana Cláudia Patrocinio, Brazil

PS01.014 – Evaluating Techniques of **Transformation Intensity for Contrast Enhancement in Mammographic** Images

Ana Cláudia Patrocinio, Brazil

PS01.015 – Influence of Contrast **Enhancement to Breast Density Classification by Using Sigmoid** Function

Ana Cláudia Patrocinio, Brazil

PS01.016 – Evaluation of the difficulties of the learning process of mammographic readings

Ana Cláudia Patrocinio. Brazil

PS01.017 – Non-deterministic optimization using Differential Evolution algorithm to launch seeds for liver segmentation in MDCT Ana Cláudia Patrocinio, Brazil

PS01.018 – Influence of ROI pattern on segmentation in lung lesions

Ana Cláudia Patrocinio, Brazil

PS01.019 – Comparison between Elliptical and Squared ROI to Launch an Automatic Seed to Region Growing Algorithm on Hepatic Segmentation using CT images

Ana Cláudia Patrocinio, Brazil

PS01.020 – Gd-based Nanoparticles Mediated Magnetic Field Enhancement Inside Homogenous **Tissue: Simulation using Finite** Element Method

Nader Riyahi-Alama, Iran

PS01.021 – Novel Cylindrical Source Tank for Inserts of Emission **Computed Tomography Phantoms** Inayatullah Sayed, Malaysia

PS01.022 – Linear tomosynthesis with flat-panel detector for image guided radiation therapy

Tae-Suk Suh, Republic of Korea

PS01.023 – Evaluation of image quality and dose for digital breast tomosynthesis (DBT) using a semianalytical model

Alessandra Tomal, Brazil

PS01.024 – Optimization of acquisition parameters of the test of an overall SPECT/CT system performance. Piotr Tulik, Poland

PS01.025 – Dosimetric Analysis of Patient to a Z-Gradient Coil in Head Magnetic Resonance Imaging

Shoogo Ueno, Japan

PS01.026 – A Novel Optical System for Contrast Enhancement in Histological Plates to Be Processed Digitally

Rubiel Vargas-Canas, Colombia

PS01.027 – Pixel-based dynamic contrast-enhanced CT study with low temporal resolution

Ivan Yeung, Canada

PS01.028 - Method for restoring CT images obtained at low doses Marlen Perez-Diaz, Cuba

PS02 – TRACK 02: BIOMATERIALS AND REGENERATIVE MEDICINE

PS02.001 – Chitosan: A Chitinous Biopolymer For The Treatment Of Crude Oil Polluted Water

Eillen Agoha, Nigeria

PS02.002 – Temperature of ice formation affects integrity of alginate 3D constructs after cryopreservation

Birgit Glasmacher, Germany

PS02.003 – Influence of proteins on magnesium in vitro degradation

Birgit Glasmacher, Germany

PS02.004 – Electrospinning of vascular prostheses with anti-kinking properties

Birgit Glasmacher, Germany

PS02.005 – Electrospinning of polycaprolactone/chitosan polymeric fibrous membranes as scaffolds for cardiovascular tissue engineering applications

Birgit Glasmacher, Germany

PS02.006 – Coaxial electrospinning of piezoelectric PVDF/PCL scaffolds for nerve regeneration

Birgit Glasmacher, Germany

PS02.007 – Bio rapid prototyping project: Evaluation of spheroid formation for cells construct

Takeshi Shimoto, Japan

PS02.008 – Scaffold Prototype for Heart Valve Tissue Engineering: Design and Material Analyses

Marcia Simbara, Brazil

PS02.009 – Unidirectionally-frozen silk/ gelatin scaffolds for cardiac tissue engineering

Siew-Lok Toh, Singapore

PS02.010 – Engineering Mesenchymal Stromal Cells (MSCs) to be More Immunoevasive by Altering Cell Culture Conditions

Sowmya Viswanathan, Canada

PS02.011 – Novel zwitterionic polypeptides for improving resistance to non-specific protein adsorption Xiaojuan Wang, People's Republic of China

PS02.012 – Study on preparation and mechanical properties of polyurethane foam with negative Poisson?s ratio

Lizhen Wang, People's Republic of China

PS02.013 – Proliferation of cardiomyocytes in neonatal, furture implication in heart regeneration

Lincai Ye, People's Republic of China

PS02.014 – Synergetic effects of released ions from CaO-MgO-SiO2based multiphase bioceramics on osteogenic proliferation and differentiation

Meng Zhang, People's Republic of China

PS10.007 - Influence of Spaces between Tactile Dot Patterns and **Raised Boundary Line on Tactile Guide Map Line Perceptibility**

Harumi Matsumori, Japan

PS10.008 – Influence of Dot Distances on Discrimination of Dot Patterns in **Tactile Guide Maps**

Harumi Matsumori, Japan

PS10.009 – Statistical Evaluation of **Objectivisation of Rehabilitation** Process

Iva Novotná, Czech Republic

PS10.010 – Satisfactory Vibrating **Conditions of Latissimus Dorsi Tendon to Induce Illusory Horizontal** Shoulder Flexion

Yumi Umesawa, Japan

PS10.011 – Satisfactory Vibrating **Conditions of Extensor Digitorum Tendon to Induce Illusory Finger** Flexion

Yumi Umesawa, Japan

PS10.012 – Prefrontal Brain Activity of **Goal Keeper when Penalty Kick**

Masaki Yoshida, Japan

PS10.013 – Effect of the moderate high pressure circumstances to metabolism

Masaki Yoshida, Japan

PS11 – TRACK 11: NEUROENGINEERING, NEURAL SYSTEMS

PS11.001 - Objective Evaluation of Likes and Dislikes by Prefrontal Blood Flows

Miho Asano, Japan

PS11.002 – Robotic Wheelchair **Commanded by People with Disabilities Using Low/High-**Frequency SSVEP-based BCI

Teodiano Bastos-Filho, Brazil

PS11.003 – Quantifying and overcoming the effect of distractions on cognitive load and brain-computer interface (BCI) performance: Implications for real-world BCI use and cognitive neuroscience

Zahra Emami, Canada

PS11.004 – How Mental Strategy Affects **Beta/Theta Neurofeedback Training**

Pedro Antonio Mou, Macao

PS11.005 – Stimulations to Basal Ganglia and the Efficiency of **Microminiaturized Electrode Recording (MER) to Quantify STN Neurons with Deep Brain Stimulator** (DBS)? the Lead Point in Parkinson **Diseased Conditions**

Venkateshwarla Raju, India

PS11.006 – SCHIZOPHRENIA: Interaction between factors Bernadete Voichcoski, Brazil

PS12 – TRACK 12: MEDICAL DEVICES

PS12.001 - Challenges and opportunities in home-based monitoring of cardiac dynamics Yashodhan Athavale, Canada

PS12.002 – Application of Support **Vector Machines in Intelligent** Monitoring of Cardiovascular Health on a Mobile Device

Omar Boursalie, Canada

PS12.003 – Design and Implementation of the Software for Multi-parameter **Patient's Monitor**

Maite Cañizares, Cuba

PS12.004 – Strategy and Tools for Validation of QRS Detection Algorithms in Real Time ECG Monitors Maite Cañizares, Cuba

PS12.005 – Basic Study on Variability of Measured Data from Touch Test Using Semmes-Weinstein Monofilaments

Manabu Chikai, Japan

PS12.006 – Design and construction of temperature and humidity control channel for a bacteriological incubator Carlos Duharte, Cuba

PS12.007 – High-Reliability Nerve Stimulator For Aiding Regional **Anesthesia Procedures**

Carlos Ferri, Brazil

PS12.008 – A study of pressurevolume characteristics of the cuff for hemodymamic parameters measurement

Jan Havlík, Czech Republic

PS12.009 – Format for National Inventory of the Genomic Technology Beatriz Hernandez. Mexico

PS12.010 – Development of the bedridden person support system using Kinect.

Kouhei Ichimura, Japan

PS12.011 – Quantitative sensory testing using lateral skin stretch at the foot for simple screening of diabetic neuropathy

Shuichi Ino, Japan

PS12.012 – A development of the robot hand for the disability which include sensory feedback.

Tomohiro Iwaki, Japan

PS12.013 – Motor cortical excitability enhanced by paired-pulse transcranial magnetic stimulation with biphasic pulse-form Petro Julkunen, Finland

PS12.014 – Quality management systems for medical devices in the production of hospital beds

Ivana Jurickova, Czech Republic

PS12.015 – Value of information analysis for use in health technology assessment

Ivana Jurickova, Czech Republic

PS12.016 – Development of a Software Tool for Quick Re-entrainment of the **Circadian Pacemaker**

Zahra Kazem-Moussavi, Canada

PS12.017 - Which one is better in detecting the speed and quantity of intravenous infusion in the hospital, transmissive or reflective optical method?

Hyun-woo Lee, Republic of Korea

PS12.018 – The effect of stented valve oversizing on hemodynamic flow in the diseased right atrium Hwa Liang Leo, Singapore

POSTERS

PS12.019 – Device trial to improve blood flow rate with controlled pressure for blood flow at venous side in single needle dialysis

Yasuyuki Miwa, Japan

PS12.020 – An Embedded Software Solution for Rest ECG Devices

Gisela Montes De Oca, Cuba

PS12.021 – Development of innovative gas phase sterilization technology for nucleolytic degradation

Toshihiko Okazaki, Japan

PS12.022 – Ultrasound Modular Platform: a general purpose open architecture system for medical imaging research

Haroldo Onisto, Brazil

PS12.023 – Design and Preliminary Validation of a Dual Mechanical-Anthropomorphic Breast Phantom with Inclusions

Shigeto Ono, United States

PS12.024 – Evaluation and Analysis of the Results of a prototype Medical Device Vigilance System (MEDEVIPAS)

Nicolas Pallikarakis, Greece

PS12.025 – Medical Device **Development – Risk Management** Mayur Patel, United Kingdom

PS12.026 – Analysis of the terminology to name medical devices used in Intensive Care Units - ICUs

Pamela Ribeiro, Brazil

PS12.027 – Determination of Breath Acetone in 298 Type 2 Diabetic Patients using a Ringdown Breath Acetone Analyzer

Meixiu Sun, United States

PS12.028 – A study of the differences between uncompressed sound source and compressed sound source gives EEG of human

Takashi Suzuki, Japan

P\$12.029 – Evaluation of the interface pressure characteristics over a temperature regulating air-mattress under different surgical positions

Eric Tam, People's Republic of China

PS12.030 – Continuous cuff-less estimation of systolic blood pressure from pulse wave transit time measured in a chair

Toshiyo Tamura, Japan

PS12.031 - A development of the pressure distribution display which is used in robot hand for the disability

Kenya Tanaka, Japan

PS12.032 – Prototype Development **Generating Vacuum for Treating Chronic Wounds Negative Pressure** Level Laboratory

Edison Vazquez-Gordillo, Mexico

PS12.033 – Tunable Irradiation System for Corneal Collagen Cross-linking

Liliane Ventura. Brazil

PS12.034 – Electromagnetic highhydrous gel phantom at a lowfrequency band -Improvement in the electrical characteristics by using a carbon microcoil and investigation of its mechanism-

Takahiko Yamamoto, Japan

PS12.035 – Examination of Bisphenol A **Elution Concentration in Dialyzers** Yoshihisa Yamashita, Japan

PS12.036 – Automation of a Dispersive Raman Spectrometer Using LabVIEW Aiming In Vivo Diagnosis of Skin Cancer

Renato Zangaro, Brazil

PS12.037 - Effectiveness of Ozone-Liquid Mass Transfer aiming Ozone Therapy Renato Zangaro, Brazil

PS12.038 - Impedance plethysmograph based on reconfigurable hardware for the study of superficial vessels

Laura Castro Acevedo, Cuba

PS12.039 - The study for bioelectric properties of tissue and organ measured by electrical impedance

Toshiaki Nagakura, Japan

PS13.003 – Becoming of Ubiquitous **Sensors for Ubiquitous Healthcare**

Sergo Dadunashvili, Georgia

PS13.004 – Design and Implementation of an Application for ECG processing in Mobile Phones

René González-Fernández, Cuba

PS13.005 – A Telemedicine System to follow-up the Evolution of Chronic **Diseases in the Community**

René González-Fernández, Cuba

PS13.006 – Developing an Appropriate and Affordable Expert System for Medical Diagnosis (ESMD) in **Developing Countries**

Kenneth Nkuma-Udah, Nigeria

PS13.007 - Assessment of Mobile **Health Applications**

Nicolas Pallikarakis, Greece

PS13.008 – An Investigation into using Pulse Rate Variability to Predict **Clinical Events**

Usman Raza, Canada

PS13.009 – A simple device producing electrolyzed water for home care Koichi Umimoto, Japan

PS13.010 – Developing predictive models using retrospective study of liver cancer patients treated with radiation therapy.

Jason Vickress, Canada

PS13.011 – A Study on the Problems for People to have Colorectal Cancer Screening Tests in Japan?-From the **Results of Interviews for 30 Adults-**

Naoko Fujiwara, Japan

PS13 – TRACK 13: INFORMATICS IN HEALTH CARE and PUBLIC HEALTH

PS13.001 – A Method for Parental Engaged Consent in the Perpetual Secondary Usage of Health Big Data Yvonne Choi, Canada

PS13.002 - RENEM? Brazilian National List of Equipment and Materials Murilo Contó, Brazil

PS14 – TRACK 14: INFORMATION TECHNOLOGIES IN HEALTHCARE DELIVERY AND MANAGEMENT

PS14.001 – DermApp: an application for Android mobile devices for reception and transmission of skin images Iván Escalona, Venezuela

PS14.002 – Use of mobile devices for prevention in youngsters of risk factors common to chronic noncommunicable diseases Iván Escalona, Venezuela

PS14.003 - Telemedicine in the Universidad Católica Andrés Bello (UCAB), Venezuela: an academic experience

Iván Escalona, Venezuela

PS14.004 - Passage from analog to digital in radiodiagnostic processes Paola Freda, Italy

PS16 – TRACK 16: CLINICAL ENGINEERING, **CLINICAL PHYSICS, AND PATIENT SAFETY**

PS16.001 - Increasing the health value per dollar spent: How Human Factors can help inform procurement of healthcare technology

Sandra Ahedo, Spain

PS16.002 – Using Heuristic Analysis to support Usability Evaluation of a low risk medical device under development process

Ana Almeida, Brazil

PS16.003 - First Contact with Human **Factors and Usability Evaluation** in a Junior Research Project by a **Biomedical Engineering Student** Ana Almeida, Brazil

PS16.004 – Non-Contact Measurement of Arterial Compliance (NCMAC) Delran Anandkumar, United Kingdom

PS16.005 – Developing a Quantitative Performance Assurance Risk **Classification Model within a** Generalized Risk Scoring System

Vishvek Babbar, Canada

PS16.006 - Project Management for **Clinical Engineering? Considerations** in the evaluation and acquisition of medical equipment for health services in Brazil

Lourdes Brasil, Brazil

PS16.007 – Human Factors for Health Technology Safety: A new book on incorporating Human Factors into the work of biomedical technology professionals

Andrea Cassano-Piche, Canada

PS16.008 - Politics, value and risk: a system to allocate medical equipment funding

Peter Cook, United Kingdom

PS16.009 – Magnetic Resonance system configuration and editing tools Danilo Da Silva, Brazil

PS16.010 – The Unintentional Irradiation of a Live Human Fetus During a CT Scan: a case study Jeff Frimeth, Canada

PS16.011 – Device reconditioning service for home-based assistance. How to choose the right approach.

Ernesto ladanza, Italy

PS16.012 – Approach to the management of infusion systems in hospitals

Ernesto ladanza, Italy

PS16.013 - A Basic Study on the **Measurement of Electromagnetic** Fields in a New University Hospital **Building Before and After the Hospital** Opened

Kai Ishida, Japan

PS16.014 – IAEA database of national dosimetry audit networks for radiotherapy

Joanna Izewska, Austria

PS16.015 – Telehealth – Achieving its Promise in 2015

Thomas Judd, United States

PS16.016 - The New Japanese Guidelines for Use of Mobile Phones in Hospitals

Takashi Kano, Japan

PS16.017 – Study on Medical Equipment Location Systems that use **RFID Technology**

Manabu Kawabe, Japan

PS16.018 – Development of a Regional **Prioritization Process for Diagnostic** Imaging Equipment Replacements

Petr Kresta, Canada

PS16.019 – Implantable Medical **Devices: more Safety with Traceability** and Surveillance

Paolo Lago, Italy

PS16.020 – Using standard test methods to ensure quality and maximize supply of personal protective equipment in a time of global emergency response

Ying Ling Lin, Canada

PS16.021 – Creation of a system for the coding of medical devices Alessio Luschi, Italy

PS16.022 – Establishment of Radiation Qualities for Radiodiagnostics in LCR/ UERJ According to IEC 61267 and TRS 457

Luis Magalhaes, Brazil

PS16.023 – A Healthcare Facilities **Qualitative and Multivariate** Quantitative Assessment Methodology for Mongolia Claudio Meirovich, Spain

PS16.024 - Practice of HB-HTA on the Study of HIFU Technology for the **Treatment of Prostate Cancer and** Uterine Fibroma

Roberto Miniati, Italy

PS16.025 – A Simulation Based Model for Planning Operating Theater Activity in Complex Hospitals: Case Study in Orthopedics

Roberto Miniati, Italy

PS16.028 - Risk management tool in the application HFMEA in purge sector on the Material and Sterilization Centers. Séraio Mühlen. Brazil

PS16.029 – Generate health and wealth by innovation

Mayur Patel, United Kingdom

PS16.030 – Validating and comparing Methods for testing Endothelial Function

Ragu Prakash Ratnakumaran, United Kingdom

PS16.031 - Reliability Indicators in the **Medical Equipment Management**

Renato Garcia Ojeda, Brazil

PS16.032 – Methodology for Safety Movement of Clinical Facilities Focused in Oncology

Sandra Rocha Nava, Mexico

PS16.033 – Design of a remote use ECG with an Optical Communication System (FSO) for Telemedicine Applications

Raul Rodriguez-Aleman, Mexico

PS16.034 – Adverse events and death related to the use of the MRI equipment Ricardo Sá, Brazil

PS16.035 - Adverse events and injuries related to the use of the MRI equipment

Ricardo Sá, Brazil

PS16.036 – Investigation on solar aging in sunglasses by developing of automated prototype for sun exposure of lenses

Homero Schiabel, Brazil

PS16.037 – Integral clearance of medical rooms based on the type of medical treatment ensures a safe environment upon first use

Casper Smit, Netherlands

PS16.038 – Real-Time Posture Classification and Correction based on a Neuro-Fuzzy Control System

Pedro Vieira, Portugal

PS16.039 – Management of electromagnetic interferences in healthcare facilities – A Review

Gnahoua Zoabli, Canada

PS16.040 – Hospital Mode Design in Smartphones and Tablets for Wireless Security in Healthcare Facilities

Gnahoua Zoabli, Canada

PS17 – TRACK 17: EDUCATIONAL AND PROFESSIONAL ACTIVITIES

PS17.001 – A discipline about Human Factors Engineering and Usability applied to Medical Devices for under graduation courses using Active Learning techniques

Ana Almeida, Brazil

PS17.002 – The medical equipment management inside the accreditation process: a comparison with the Brazilian accredited hospitals

Rodrigo Almeida, Brazil

PS17.003 – The Medical Physics M.Sc. program at the National University of Mexico: Results and lessons learned after 100+ graduates

María-Ester Brandan, Mexico

PS17.004 – An Experience on the dosimetry of HDR Brachytherapy Treatment Planning of Cervical Carcinoma at BPKM Cancer Hospital, Nepal

Surendra Chand, Nepal

PS17.005 – Health IT Education for Clinical Engineers Thomas Judd, United States PS17.006 – Professional Development of Medical Physicists in Radiation Oncology for the Commonwealth of Independent States

Marina Kislyakova, Russian Federation

PS17.007 – Assistive Technologies in Biomedical Engineering Education Lenka Lhotska, Czech Republic

PS17.008 – Future-Proofing Physics and Engineering in Medicine

Kwan Hoong Ng, Malaysia

PS17.009 – Nuclear and Radiological Emergencies – First IAEA Training Course for Medical Physicists Fridtjof Nuesslin, Germany

Thayor Nuessiin, Germany

PS17.010 – Academic Real Time Digital Medical Image Processing Environment

Ana Cláudia Patrocinio, Brazil

PS17.011 – Detection of Eye Movement; possibility how to control world Lukas Peter, Czech Republic

PS17.012 - Artificial Neural Network Interactive Activation and Competition Model Service-Oriented Applied to Health

Lourdes Mattos Brasil, Brazil

PS17.013 – Career Progression for Medical Physicists

Wiiliam Round, New Zealand

PS17.014 – IOMP-W ? the International Organization for Medical Physics Women Subcommittee

Magdalena Stoeva, Bulgaria

PS17.015 – AAPM/IOMP Used Equipment Donation Program Mohammed Zaidi, United States

PS18 – TRACK 18: GENDER, SCIENCE AND TECHNOLOGY

PS18.001 – Bone density measurements in strontium-rich bone-mimicking phantoms using quantitative ultrasound Bisma Rizvi, Canada

PS19 – TRACK 19: BIOPHYSICS AND MODELLING

PS19.001 – Numerical Modeling Of The Electrical Impedance Method Of Peripheral Veins Localization *Mugeb Al-Harosh, Russian Federation*

PS19.002 – Modeling current density maps in the heart

Mohammadali Beheshti, Canada

PS19.003 – Finite Element Modeling of Gelatin Phantom from Measured Impedance Spectra

Pedro Bertemes-Filho, Brazil

PS19.004 – Prediction of radiation induced direct and indirect cellular damage using a novel ionisation spatial clustering algorithm

Eva Bezak, Australia

PS19.005 – Research on Vibration of Cell Membrane of Plant Seed with Ultrasonic Excitation

Hui Cao, People's Republic of China

PS19.006 – The Effect of Applied Force on Arterial Pulse with a New Flexible Pressure Sensor

WENXUAN Dai, Hong Kong

PS19.007 – The Art of Engineering Medicine: A New Fast Non-Invasive Method to Directly Assess Ischemia in Human Diseased Coronary Arteries

lyad Fayssal, Lebanon

PS19.008 – Influence of the alteration of the flow topology during the abdominal aortic aneurysm growth Joly Florian, Canada

PS19.009 – Using the DDST to Train and Test Anthropomorphic Robotic Children

Paul Frenger, United States

PS19.010 – The new low-cost metaphase finder for biological dosimetry

Akira Furukawa, Japan

PS19.011 – Concentrated photoactivation: focusing light through scattering Pedro Vieira, Portugal

PS19.012 – Steered Molecular Dynamic Simulation Approaches for computing the Blood Brain Barrier (BBB) Diffusion Coefficient

Ebrahim Ghafar Zadeh, Canada

PS19.013 – The study of the relationship between the scatterer particle size of soft tissue in ultrasonic focal region and the frequency offset of backscattered signal

Jianzhong Guo, People's Republic of China

PS19.014 – Dynamic Model for Shear Stress-Dependent NO and Purine Nucleotide Production from Endothelial Cells

Patrick Kirby, United States

PS19.015 – Mechanism of Phospholipase as a Potential Anti-Bacterial Drug Revealed by Nonlinear Spectroscopy

Xiaolin Lu, People's Republic of China

PS19.016 – Cancer stem cells in a hierarchical model of tumour regrowth in five head and neck carcinomas

Loredana Marcu, Australia

PS19.017 – Effects of interaction with electromagnetic field on cell culture of Saccharomyces cerevisiae

Aracely Martínez, Mexico

PS19.018 – Obstructive and Sclerotic Disorders affecting Carotid Blood Flow to the Brain

Onaizah Onaizah, Canada

PS19.019 – Estimation of Tissue Temperature in Tumor Hyperthermia Using Ultrasonic Methods

Xiao-jian Wang, People's Republic of China

PS19.020 – Modeling of a Photosensitzer Distribution Relevant to Photodynamic Therapy of Malignant Non-Pigmented and Pigmented Tumors

Marta Wasilewska-Radwanska, Poland

SHARPEN YOUR EDGE AGAINST CANCER.

Edge Radiosurgery: Making radiosurgery an option for more patients.

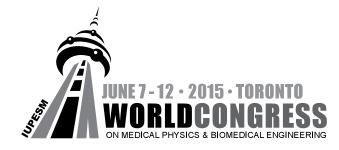

Deliver accurate radiosurgery treatments quickly and efficiently with the Edge[™] radiosurgery system. Edge's advanced technology enables you to offer powerful, non-invasive radiosurgery treatments anywhere in the body where radiation is indicated. Expand treatment options for patients and gain a competitive edge with the system as dedicated as you are.

Visit us at IUPESM World Congress 2015. Booth #1234. Learn more about Edge Radiosurgery at varian.com/Edge VARJAN medical systems A partner for life

Radiation treatments may cause side effects that can vary depending on the part of the body being treated. The most frequent ones are typically temporary and may include, but are not limited to, irritation to the respiratory, digestive, urinary or reproductive systems, fatigue, nausea, skin irritation, and hair loss. In some patients, they can be severe. Radiation treatment is not appropriate for all cancers. See varian.com/use-and-safety for more information.

SP001 - Image Processing and Visualization: Part 1

TRACK 01: IMAGING

SP001.1 - The Use of Wavelet Filters for Reducing Noise in Posterior Fossa Computed Tomography Images

Author(s): Reinaldo Pita-Machado¹, <u>Marlen Perez-Diaz</u>², Juan E. Paz-Viera², Juan V. Lorenzo-Ginori², Yusely Ruiz-Gonzalez² ¹Tomography, 1 Centro de Ingeniería Clínica y Electromedicina, Santa Clara/CUBA, ²Study Center On Electronic And Information Technologies, Universidad Central "Marta Abreu"de las Villas, Santa clara/CUBA

This paper describes an experimental search for the best wavelets, to reduce *Poisson* noise in CT.

Five slices containing the posterior fossa from an anthropomorphic phantom and from patients were selected. As their original projections contain noise from the acquisition process, some simulated noise-free lesions were added on the images. After that, the whole images were artificially contaminated with *Poisson* noise over the sinogram-space. The configurations using wavelets drawn from four wavelet families, using various decomposition levels, and different thresholds, were tested in order to determine de-noising performance. The 10 preselected best filters were *Sym4*, *Bior3.5*, *Bior3.7*, *Coif3*, *Coif5*, *dB3*, *dB45*, *db8*, *Sym 20*.

The quality of the resulting images was evaluated using Contrast to Noise Ratio (*CNR*), Human Visual System absolute norm (*H1*),Mean Structural Similarity Index (*MSSIM*) and *the jackknife free-response* methodology. The results were compared with other traditional filters.

The de-noising with wavelet filters improved the image quality of posterior fossa region in terms of an increased *CNR* (see Fig.1), without noticeable structural distortions (see Fig. 2).

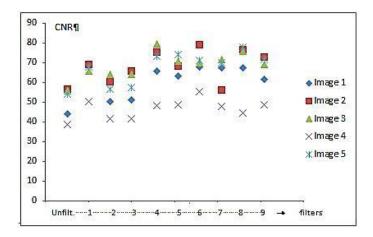

Fig. 1.Contrast to Noise Ratio for filtered and unfiltered images

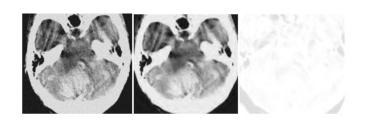

Fig. 2. Region of interest in fossa a) contaminated unfiltered image, b) the corresponding filtered image with *Coif3* and c) *MSSIM* map.

The precision in the observers' reply improved with the filtering procedure in all the cases respect to unfiltered images (p=0.0003). The procedure facilitated the localization of small lesions in fossa.

The wavelet filter Coif 3 (MSSIM = 0.8152) had the best performance. It was also better than Median (MSSIM = 0.7914) or Wiener filters (MSSIM = 0.7796) and similar to Butterworth (MSSIM = 0.8228) to remove similar amount of noise with lower spatial resolution lost.

In Conclusion: Wavelet filtering is an alternative to be considered for *Poisson* noise reduction in image processing of posterior fossa head CT images.

SP001.2 - Automatic Liver Localization based on Classification Random Forest with KNN for Prediction

Author(s): Benwei Gong, Baochun He, Qingmao Hu, <u>Fucang Jia</u> Shenzhen Institutes of Advanced Technology, Chinese Academy of Sciences, Shenzhen/CHINA

Purpose

Automatic, robust localization of liver in CT images is a prerequisite for robust liver segmentation. Fast, accurate localization of liver is challenging due to the variation in the appearance and shape, and the ambiguous boundaries between the liver and its neighbor organs. Liver segmentation using statistical shape models have shown significant potential, however, wrong localization of the liver region often cause the failure or inaccuracy. By combining and refining the state-of-the-art random forest technique, classification random forest with K Nearest Neighbor (KNN) model was proposed for liver localization.

Methods

In our approach, localization of liver region was taken as the problem of initial segmentation, and the method mainly consisted of two phases: interface localization and K-NN based classification random forest for prediction.

Interface localization: The interface between the abdominal cavity and thoracic area was located as a reference for liver region. Since the intensity features was apparent in lung region (thoracic cavity), a differential model based on such characteristic was used to localize the interface of the right side of the body. Then, the relative spatial coordinates and the relative structural prior with Gaussian kernel function were calculated.

K-NN based Random Forest: To construct an ensemble of independent decision trees without over-fitting, the number of the samples for each class was balanced. A subset of entire datasets as well as feature vectors was randomly chosen for each tree. Besides, the corresponding training samples were stored in each leaf node.

In testing phase, the samples shared similar features will be splitted into the same leaf node. The K-NN based method was used, which relied on the hypothesis that samples from the same structures not only share such features, but are closely localized in image spaces. Euclidean distance was used in the K-NN model. In the leaf node of each decision tree, testing samples are predicted with a K-NN model using the relative spatial location and the structural prior of the liver.

Results

The performance of our method for liver localization was tested on 19 contrast enhanced CT datasets from Visceral challenge (http:// www.visceral.eu). We adopted the leave-one-out cross validation using Dice coefficient and Hausdorff distance metric. Compared with AdaBoost and traditional random forest method, our methods had a Dice coefficient of **0.878±0.043** and a Hausdorff distance of **22.13±10.12mm**, while AdaBoost with a Dice coefficient of **0.795±0.075** and a Hausdorff distance of **30.94±9.41mm**; and traditional random forest with a Dice coefficient of **0.829±0.134** and a Hausdorff distance of **30.42±13.42mm**. Paired t-test was used to compare among the three methods, and the difference was statistically significant (p<0.001) except the Dice coefficient of our method and the traditional random forest.

Conclusion

We have proposed a fully automated approach for robust liver localization. As in medical images, anatomy structures are spatially dependent, we applied a spatial KNN model to predict the testing sample from k nearest samples from the same leaf node. Compared with AdaBoost and traditional classification random forest, our method has higher performance.

SP001.3 - Brain Tumor Target Volume Segmentation: Local Region Based Approach

Author(s): Mehdi Astaraki¹, Hossein Aslian²

¹Biomedical Engineering, IAU Science and Research branch, Tehran/IRAN, ²Medical Physics, International Centre for Theoretical Physics (ICTP) and university of Trieste, Trieste/ITALY

In this paper, we comprehensively evaluated clinical application of local robust-region based algorithms to delineate the brain target volumes in radiation therapy treatment planning. Localized region based algorithms can optimize processing time of manual target tumor delineation and have perfect correlation with manual delineation defined by oncologist due to high deformability. Accordingly, they can receive much attention in radiation therapy treatment planning. Firstly, clinical target volumes (CTVs) of 135 slices in 18 patients were manually defined by two oncologists and the average of these contours considered as references in order to compare with semiautomatic results from different four algorithms. Then, four localized region based algorithms named Localizing Region Based Active Contour (LRBAC), Local Chan-Vese Model (LCV), Local Region Chan-Vese Model (LRCV (and Local Gaussian Distribution Fitting (LGDF) were applied to outline CTVs. Finally, comparisons between semi-automatic results and baselines were done according to three different metric criteria: Dice coefficient, Hausdorff distance, and mean absolute distance. Manual delineation processing times of target tumors were also performed. Our result showed that LCV has advantage over other algorithms in terms of the processing time and afterward LRCV is the second fastest method. LRBAC was the second slowest technique; however, we found that processing speed in LRBAC can be almost doubled by replacing the time-consuming re-initialization process with energy penalizing term. Accordingly, due to high accuracy performance of LRBAC algorithm, it can be concluded that the modified version of LRBAC has the best performance in brain target volumes in radiation therapy treatment planning among other localized algorithms in terms of speed and accuracy.

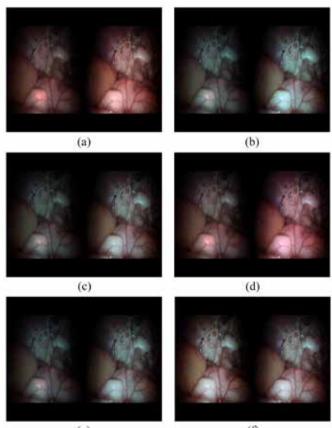

SP001.4 - A Novel Automatic White Balance Algorithm for the 3D Image of Stereoscopic Endoscopy

Author(s): Yuan Hai¹, <u>Ling Li</u>², Gu Jia² ¹Shenzhen College Of Advanced Technology, University of Chinese Academy of Sciences, Shenzhen/CHINA, ²Shenzhen Institutes Of Advanced Technology, Chinese Academy of Sciences, Shenzhen/ CHINA

Objectives: Automatic white balance is an important function of stereoscopic endoscopy. The 3D image often contains color mismatch and different luminance between two stereo views. It will lead to many problems applying traditional white balance methods for each image of 3D images independently. In order to solve those problems, we proposed a novel automatic white balance algorithm for the 3D image of stereoscopic endoscopy.

Methods: The proposed algorithm consists of three steps: choosing the reference image from two stereo views, adjusting the reference image by the white balance method and color matching. The second step is divided into three parts: the probable white point detection, the white point selection, and the white point adjustment. We use dynamic thresholds to detect white points.

Results: In order to test the effectiveness of the proposed algorithm, the 3D image of stereoscopic endoscopy with color cast is processed by the proposed method, the gray world method (GWM), the robust automatic method (RAWB), the Varsha Chikane's automatic white balance method (VCAWB), and the perfect reflector method (PRM) as illustrated in Fig.1. Further, for making more precise comparisons among the methods, we use the scores of Euclidean Distance(ED) as objective evaluative values. A lower value is expected. At the same time, the values of Bhattacharyya Distance (BD) between two stereo views are calculated to show the similarity degree of two stereo views, the smaller the better. The results are shown in Table 1.

(f)

Table 1 The values of ED and BD for the 3D image of stereoscopic endoscopy						
	Original	GW	RAWB	VCAWB	PRM	Proposed method
ED-left	31.403	24.757	28.049	27.005	27.352	12.080
ED-right	18.974	13.610	13.886	16.235	14.913	12.114
ED-average	25.189	19.184	20.968	21.620	21.133	12.097
BD	0.203	0.202	0.205	0.180	0.194	0.005

Conclusions: The experimental results show that the proposed method performs better than others in the effectiveness of white balance and the similarity degree of two stereo views is much improved after applying the proposed method.

SP001.5 - A new log-compression rule for B-mode ultrasound imaging adjusted to the human visual system

Author(s): <u>Ramon C. Fernandes</u>¹, Tiago M. Machado¹, Johannes D. Medeiros Junior¹, Haroldo J. Onisto¹, José E. Bertuzzo¹, Eduardo T. Costa²

¹Department Of Services And Hardware Engineering, Eldorado Research Institute, Campinas/BRAZIL, ²Biomedical Engineering Department, University of Campinas, Campinas/BRAZIL

Introduction: Medical ultrasound imaging has become a major diagnostic technique for searching anatomical and functional pathologies. In B-mode image formation, log compression is the process by which the signal is rendered more suitable for visual analysis. The current ultrasound scanners consider only the image dynamic range, usually understood as the signal range that will be linearly mapped to a grayscale and displayed on a screen. However, human visual system characteristics should be better considered in the image processing as well, requiring understanding of the principles of image formation and their influence on visual perception. Our objective is to present a new log compression rule applied to ultrasound images that also accounts for the characteristics of the human visual system.

Methodology: This new log compression method is not only unique for presenting the whole ultrasonic signal compressed to a certain range and not just part of its dynamic range, but for considering more features, such as contrast and its relation to dynamic range and to brightness perceived by the eyes, or visually distinguishing neighboring tones. Our proposed model for logarithmic compression is divided into three stages: compression, mapping and tonal adjustment. The compression presents, on a logarithmic scale, the signal amplitude compressed to the chosen range; the mapping step relates the intensity of the post-compression with a grayscale level using a sigmoid curve that tends to change the contrast in the central intensity levels giving priority to texture perception and improving contrast. The last step takes into account the tonal differentiation (proposed by Liu and Huang), which determines the distance between tones that make them distinct. The proposed method was tested with phantom images obtained with a commercial B-mode scanner that allows the capture of raw data for image and signal post processing. The results were compared to those of traditional compression methods. We have quantified image information loss for each log compression method using the error relative to the original signal information. All image and data processing were carried out using Matlab®.

Results, Discussion and Conclusions: We noted that for the classical model used in almost all ultrasound systems, there is a signal "clipping", with its amplitude saturated to lower and upper thresholds, producing flat cutoffs. So, just a small part of the total dynamic range is used in the traditional method, leading to possible loss of background information of the image. The proposed method,

however, preserves signal integrity. The proposed log compression is more suitable to human vision, by considering contrast perception and tone differentiation and, since it preserves the echo information, it is better to represent the structures contained in the ultrasonic signal. The proposed method has lead to relative error of less than 0.01% (best case) or 4.5% for the worst case. The proposed method shows potential to reduce compression parameter adjustments for imaging of the anatomical structures of interest.

SP001.6 - Comparison of Independent Component Analysis (ICA) Algorithm for Heart Rate Measurement Based on Facial Imaging

Author(s): Lina Septiana¹, Freddy Haryanto², Kang-Ping Lin³ ¹Electrical Engineering, Krida WacanaChristian University, Jakarta/ INDONESIA, ²Department Of Physics, Institut Teknologi Bandung, Bandung/INDONESIA, ³Department Of Electrical Engineering, Chung Yuan Christian University, Taoyuan/TAIWAN

This paper deals with the heart rate measurement by performing automatic face tracking and blind source separation of three color channel into independent components. A class of the so-called Independent Component Analysis (ICA) represents a powerful tool for such a detection. Various ICA algorithms have been introduces in the literature; therefore there is a need to compare these methods. In this contribution, two of the most common ICA methods are studied and compared to each other as regarding their ability to recover the independent source signal from normalized RGB of the facial image. These are the Joint Approximate Diagonalization of Eigen matrices (JADE), and the Second Order Blind Identification (SOBI). These two algorithms have been applied to the same data set of RGB traces then compare with commercially calibrated BPV sensor. Both two methods have given approximately consistent results. However SOBI method has shown better accuration of heart rate measurement over JADE.

SP002 - Stem Cells in Tissue Engineering and Regeneration

TRACK 02: BIOMATERIALS AND REGENERATIVE MEDICINE

SP002.1 - Biomaterials and Regenerative Medicine: Micro-environmental Modulation for Controlled Cell Differentiation and Tissue Development

Author(s): <u>Gilda Barabino</u>¹, Stephen Goldman², Yueh-Hsun Yang³ ¹The Grove School Of Engineering, Dean, The City College of New York, New York/NY/UNITED STATES OF AMERICA, ²Army Institute of Surgical Research, San Antonio/TX/UNITED STATES OF AMER-ICA, ³The City College of New York, New York/NY/UNITED STATES OF AMERICA

The engineering and regeneration of tissues and organs holds great promise for the treatment and prevention of disease and is enabled by natural and synthetic biomaterials that serve as anchors for bioactive molecules and cells. Successful creation of engineered tissues requires a thorough understanding of microenvironments that regulate cellular behavior and tissue formation. Microenvironments define the immediate surroundings of a cell and encompass essential mediators such as soluble factors and extracellular matrix molecules bound to the cell and to adjacent cells. Tissue engineering approaches that aim to manipulate culture parameters and emulate natural microenvironments are sought by combining cells, bioactive agents and biocompatible or biodegradable materials in scalable bioreactors. Among these components, scaffolds or hydrogels made of synthetic or naturally derived polymers are fabricated to meet the requirements for cell survival, matrix biosynthesis, mechanical integrity and integration capacity with host tissues and thus provide appropriate three dimensional substrates for cell growth and tissue development. Bioreactor systems do their part by delivering biophysical and mechanical cues to cultured cells in a tunable, welldefined environment, which greatly improve mass transfer efficiency and tissue quality. Lately, adult stem cells derived from different origins such as bone marrow and adipose tissues have become attractive for repair and regeneration of damaged tissues or organs due to their multi-potency and expandable lifespan, yet achieving controlled stem cell differentiation into a desired cell lineage remains challenging. As an important step toward the fabrication of clinically relevant functional tissue replacements, our laboratory has focused on developing combinatorial methods that endeavor to understand the synergy between cells and micro-environmental factors in order to optimize culture conditions for stem cell differentiation and tissue regeneration. This talk will summarize recent examples of tissue engineering strategies for development of cartilage tissue constructs using stem cells, hydrodynamic bioreactors and microfluidic hydrogels.

SP002.2 - Defining the regulatory metrics for regenerative medicine using novel biomaterial tagging strategies Author(s): <u>Alicia J. El Haj</u>, Katie Bardsley, Ying Yang Institute Of Science And Technology In Medicine, Keele University, Stoke-on-trent/UNITED KINGDOM

Biomaterials can provide a useful platform for controlling the regeneration of tissues with or without the use of different types of stem cells. In order to meet the regulatory needs for clinical use, the standards must be established which enable the complex products to be manufactured in a reproducible way. A non-destructive protocol which can define a biomaterial's degradation and its associated ability to support proliferation and/or promote extracellular matrix deposition or differentiation could be an essential tool for process

manufacturing in regenerative medicine. To achieve this aim, we have designed fluorescent tagged degradable materials which can be monitored on line non-invasively in vitro for assessment of tissue engineered products and also in vivo for measuring tissue regeneration in vivo. Three fluorescently tagged biomaterials, chitosan, fibrin and poly(ethylene glycol) diacrylate-fibrinogen conjugates, were fabricated and the effect of their degradation on cell proliferation and osteogenic protein production was investigated. Alterations observed in fluorescence retention within the biomaterials and the release of fluorescent soluble by-products accurately quantified degradation and was cross-validated by weight loss measurements. Assessment of biomaterial behaviour with and without cells has been measured in vitro in bioreactors, ex vivo and in vivo in rat models. Degradation was shown to have a significant effect on cellular activities, with faster degradation eliciting a decreased cell proliferation and concurrently an increased osteopontin production. A turnover index (TI), which directly describes the effect of biomaterial degradation on cell behaviour, has been defined, with high TIs for matrix production observed on fast degrading biomaterials. This novel TI has the potential to become an essential tool for tissue engineers as it has the ability to highlight biomaterials which are suitable for various applications, such as cell proliferation or differentiation. This ability to predict cellular reactions and pre-select certain biomaterials before clinical studies would be invaluable tool not only for tissue engineering but for regenerative medicine as a whole and may lead to the development of clinically successful therapies.

SP002.3 - The role of electric fields in promoting precursor cell migration to enhance wound repair

Author(s): <u>Stephanie Iwasa</u>¹, Robart Babona-Pilipos², Milos R. Popovic¹, Cindi M. Morshead³

¹Institute Of Biomaterials And Biomedical Engineering, University of Toronto, Toronto/ON/CANADA, ²Toronto Rehabilitation Institute, University Health Network, Toronto/ON/CANADA, ³Department Of Surgery, University of Toronto, Toronto/ON/CANADA

Studies have shown that endogenous electric fields (EFs) are important for directed cell migration and further, externally applied EFs have demonstrated success in promoting wound closure. However, the cellular mechanisms of this therapy remain unclear and limit its potential use. We have previously demonstrated that neural stem and progenitor cells (together termed neural precursor cells, NPCs), undergo rapid and directed cathodal migration in the presence of an EF in vitro. Notably, differentiated NPCs do not undergo rapid and directed migration in the presence of an EF. To build on this finding, fluorescent NPCs are plated on ex-vivo spinal cord or brain slices to examine NPC migration in a more biologically relevant environment. Initial results show NPCs migrate in the presence of an EF on spinal cord slices, albeit at a slower speed. We hypothesized that the induced cell migration in the presence of EFs is a generalized feature of precursor cells regardless of their tissue of origin. We tested our hypothesis using skin-derived precursor cells (SKPs), found in the dermal papillae of the skin. SKPS are multipotent and give rise to mesodermal and neural progeny. We examined SKPs colonies isolated in vitro and performed the same migration assay as per the NPCs. Interestingly, unlike in NPC migration where >98% of the cells migrated in the EF, the vast majority of SKP cells did not migrate. Of the few cells that displayed directed migration, ~1% migrated to the cathode while another small subpopulation migrated rapidly towards the anode. We have demonstrated through PCR and live-imaging that NPCs express voltage gated calcium channels (VGCCs) that are critical for migration. Indeed, blocking VGCCs leads to a significant reduction in the speed of migration. We predicted the lack of SKP migration might also be the result of the lack of VGCC expression. However, we found that SKPs expressed similar VGCCs to NPCs, suggesting that this was not the reason for the lack of migration. We next proposed that SKPs were differentiating into mature phenotypes in our culture conditions and hence lost their migratory

ability as was seen with differentiated NPC cultures. Our preliminary staining reveals that a small population of plated cells express the neural precursor cell marker Nestin and we hypothesize that it is this neural precursor subpopulation of SKPs that is demonstrating cathodal migration. We are further characterizing the phenotypes of cells migrating towards the anode. Together these findings suggest that cells maintaining a neural precursor phenotype are responsive to EF's, regardless of their tissue of origin.

SP002.4 - The role of niche architecture on muscle stem cell division orientation

Author(s): <u>Richard Y. Cheng</u>¹, Penney Gilbert² ¹Ibbme, University of Toronto, Toronto/ON/CANADA, ²Ibbme, University of Toronto, Toronto/CANADA

Skeletal muscle is comprised of muscle fibres (myofibres) that are embedded within connective tissue. Reconstruction of the adult muscle tissue relies on a pool of resident committed muscle stem cells (MuSCs) situated between the basal lamina and sarcolemma known as "satellite cells" which express the paired-box transcription factor Pax7 necessary for their specification during embryonic development and long-term maintenance during adult life. To maintain tissue homeostasis, MuSCs undergo asymmetric division to produce a committed daughter cell that repairs damage to local fibers and an uncommitted daughter that repopulates the niche. Upon an injury where extensive regeneration is required, MuSCs undergo symmetric divisions in which two uncommitted daughter cells are produced to expand the myogenic progenitor pool. Recent studies indicate that MuSC 'stemness' is contingent on maintaining contact with the basal lamina during division such that asymmetric divisions occur in an apical-basal orientation with respect to the fiber, while symmetric divisions proceed in plane with the fiber (planar). Understanding the molecular mechanisms by which MuSCs undergo cell fate decisions, especially self-renewal, during muscle regeneration is a fundamental goal of modern muscle research.

Using a cyclic compression machine to evaluate the Young's modulus, we found that the bulk stiffness of regenerating muscle is significantly higher compared to healthy control mice. We propose that these changes manifest due to the increased deposition of extracellular matrix (ECM) components in the MuSC niche immediately after injury. We confirmed this using immunohistochemistry and western blotting and observed that the injured MuSC niche contains increased amounts of aligned ECM components such as collagen, fibronectin, and laminin. In addition, atomic force microscopy on isolated individual fibers revealed significant differences between the stiffness of healthy fibers versus injured fibers, indicating that the increased ECM during regeneration is associated with a stiffer niche, which is an aspect capable of modulating MuSC self-renewal in culture as previously showed. To understand if fibrosis alters the niche architecture by physically restricting apical-basal oriented division, we mimicked the healthy and regenerating niche by culturing isolated muscle fibers within soft (12kPa) and stiff (24kPa) agarose gels. Confocal timelapse microscopy allowed us to track cell division orientations over 48 hours of 3D culturing, and here we report that MuSC in a soft environment had a tendency to divide both in the apical-basal (75%) and planar direction (25%), whereas the stiff environment was permissive for mostly planar divisions (84%). Together, this data suggests that changes in the niche architecture due to increased ECM deposition during regeneration play a significant role in supporting MuSC division orientation.

SP002.5 - Mapping the Stem Cell's Mechanome using Paired Live Cell Multiplexed Imaging and Modeling Author(s): <u>Melissa L. Knothe Tate</u> Graduate School Of Biomedical Engineering, University of New

South Wales, UNSW Sydney/AUSTRALIA

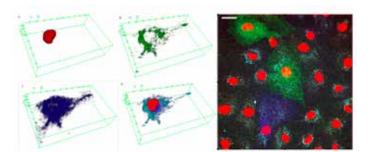

INTRODUCTION

A series of studies using model mesenchymal stem cells [1-5], primary embryonic stem cells [6], and primary adult stem cells [7,8], has established the profound role of mechanoadaptation on lineage commitment and tissue genesis. Here we aimed to develop novel methods to allow for live cell multiplexed fluorescent imaging for the spatiotemporal distribution of the cell nucleus, membrane and cytoskeleton concomitant to delivery of controlled mechanical stresses and measuremennt of sub-/cellular strains.

METHODS

Cells were cultured *per* previous protocols [1,9] to achieve targeted densities and developmental contexts. Cells were tagged at time zero with Con-A conjugated, microbeads [4]. Actin and tubulin were tagged during transcription using BacMem 2.0 assays (Invitrogen) [3]. Live cell membranes and nuclei were stained using Cyto9, Hoechst, and fluorescence-tagged Wheat Germ Agglutinin [3,10]. Thus, the displacement and spatiotemporal distributions of each cellular constituent could be tracked as a function of controlled mechanical environment (Fig 1). Using a paired multiphysics computational model (Comsol) [5], we then mapped deviatoric and dilatational stresses as a function of stem cell mechanoadaptation.

RESULTS

Live stem cell imaging of the nucleus (red), actin (green), tubulin (blue) and compiled cell structure, followed by multicell image, depicting the same cellular constituents spatially. Scale bar: 20 microns.

DISCUSSION

The novel paired imaging and modeling method allows for live cell multiplexed fluorescent imaging of cell/nucleus shape and volume concomitant to monitoring of spatiotemporal actin and tubulin distribution, as well as *in situ* strain assessment. Akin to mechanical testing of a cell as it evolves and optimizes its structure for prevailing dynamic function, the novel method will enable elucidation of the underlying mechanisms of stem cell mechanoadaptation, potentially paving the way for targeted delivery of physical cues to achieve targeted tissue genesis and healing.

SP003 - Brachy Therapy: Part 1

TRACK 04: RADIATION ONCOLOGY

SP003.1 - The impact of in-homogeneity corrected dose calculations for various clinical HDR brachytherapy sites. Author(s): S V. Jamema, <u>Siji Paul</u>, Reena Devi, Kishore Joshi, Mayur Sawant, Pooja Moundekar, Deepak Deshpande Medical Physics, Tata Memorial Hospital, Mumbai/INDIA

Purpose: To determine and the impact of in-homogeneity corrected dose calculations for various clinical brachytherapy sites, and to quantify the variation between the two algorithms: TG 43 & Acuros.

Methods: Various clinical sites have been investigated: surface mould of the nose, base of tongue-tonsil implant, soft tissue sarcoma of the chest wall, breast multi catheter APBI, lip, eyelid implant, and gynaecological applications which consisted of two applicators, namely Vienna and ring made up of polymer and stainless steel material respectively. After the implantation, CT scans were obtained, followed by reconstruction of the implant, dose calculation and treatment delivery. The clinical dose calculations were carried out using TG 43 algorithm, which were then re-calculated using Acuros model based dose calculation (Eclipse v 10, VMS). The dose to the target, OARs were evaluated using the DVH parameters, volumes of various isodose levels (V300%, V200%, V100%, V50%) and isodose distribution.

Results: TG 43 overestimated the dose as compared to Acuros for all the implant types. Implants such as eyelid and lip had larger variation >10%, while implants of breast, soft-tissue sarcoma of the chest wall and base of tongue resulted in variation of the order of 5-10%. The gynaecological implants resulted with lowest variation of <5% (Table 1). In surface mould of the nose, the mean dose to the ipsilateral eye resulted in a variation of 11%, while in tongue implant, the dose to the underlying bone resulted in a variation of 9%. In soft tissue sarcoma and breast implant, TG 43 over estimated the dose to the skin by 20 and 35 cGy while the dose to the lung was underestimated by 10cGy per fraction (prescription dose: 4Gy/fraction) (Figure 1). The dose profile at the superficial region was overestimated by 50cGy and 200cGy for lip and eye lid implant.

Conclusion: The impact of in-homogeneity corrected dose calculations for various clinical brachytherapy sites, between the two algorithms, TG 43 & Acuros has been quantified.

Gynaecology-ring applicator	4±0.7

SP003.2 - A novel QA device for brachytherapy applicator QA Author(s): Yi Le, <u>Sook Kien Ng</u>, Esteban Velarde, Elwood Armour, John Wong

Radiation Oncology, Johns Hopkins University, Baltimore/UNITED STATES OF AMERICA

Purpose/Objective(s):

The commissioning and routine quality assurance (QA) of the source positions for HDR applicators usually requires double exposures of films which is time consuming. The objective of this study is to develop an effective and efficient filmless method for evaluating dwell positions of HDR applicators using a novel QA device.

Materials/Methods:

<u>Material</u>: A device that unifies comprehensive real-time mechanical and dosimetric QA measurements has been developed in our institute for routine external beam QA originally and extended to brachytherapy application. This device comprises an imaging surface for receiving multiple energy sources, a camera for measuring and recording data related and a mirror system for directing the energy sources to a stationary camera. The imaging surface has a resolution of 0.25 mm. Source dwell positions QA for HDR ring and tandem (R&T) applicator sets was performed using this device as a case study.

Methods: R&T applicator sets were secured to the imaging surface of the QA device (Figure1a). Two sets of images of the applicators were acquired by the QA device. First set of mages were acquired using fluoroscopy x-ray with dummy marker in the applicators (Figure 1b). This serves as the reference image and provides the markers' positions for comparison with active source positions. The second set images were acquired using HDR Ir-192 sources (Figure 1c). The images were acquired in integration mode with 20 second integration time. Measurements were repeated five times for each set of applicator and the mean value of the dwell position were determined (Figure 1b). No image registration is necessary since the images were taken by the same device at same location. Data analysis was automated using MATLAB to improve efficiency and eliminate user dependence.

Results:

Tandem applicator measurements indicated all dwell positions were within 1.0 ± 0.4 mm from the dwell positions to the corresponding dummy markers. The most distal dwell position for the ring applicator was found to be within 1.2 ± 0.7 mm from the tip of the dummy mark. Results for symmetric source position analysis are in good agreement with the recommended angle (90°). Using this QA device, the applicator sets only need to be setup once on the imaging surface for repeat measurements.

Conclusions:A method utilizing a novel QA device for HDR applicators QA was demonstrated. The digital high resolution images allow the source dwell positions to be determined quantitatively. Automatic data analysis method significantly reduces time required for repeat measurements.

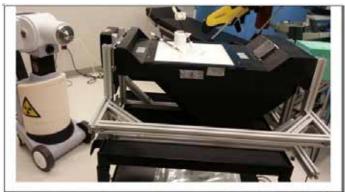

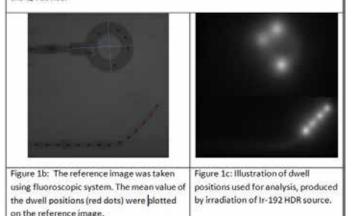

Figure 1a: Ring and tandem applicator sets were secured to the imaging surface of the QA device.

SP003.3 - Electromagnetic tracking for catheter reconstruction in ultrasound-guided high-dose-rate brachytherapy of the prostate

Author(s): Shyam Bharat¹, Cynthia Kung¹, Ehsan Dehghan¹, <u>Alexandru M. Nicolae²</u>, Ananth Ravi², Niranjan Venugopal³, Antonio Bonillas¹, Doug Stanton¹, Jochen Kreucker¹

¹Philips Research North America, New York/UNITED STATES OF AMERICA, ²Medical Physics, Odette Cancer Centre, Toronto/CANA-DA, ³Saskatoon Cancer Centre, Saskatoon/CANADA

Purpose: The accurate delivery of high-dose-rate (HDR) brachytherapy is dependent on the correct identification of the position and shape of the treatment catheters. In many brachytherapy clinics, transrectal ultrasound (TRUS) imaging is used to identify these catheters. However, manual catheter identification on TRUS can be time consuming, subjective, and operator dependent due to a number of imaging artifacts. We report the use of electromagnetic (EM) tracking technology to determine the position and orientation of catheters inserted in a tissue-equivalent prostate phantom.

METHODS AND MATERIALS: An Aurora EM system (NDI, Waterloo, ON, Canada) was used in this experiment. The accuracy of the EM system was quantified using a three-axis robotic system. In addition, EM tracks acquired from catheters were compared with catheter positions determined from TRUS and CT images, to compare EM system performance to standard clinical imaging modalities. The tracking experiments were performed in a controlled laboratory environment (no EM-signal distorters present), and in a typical brachytherapy operating room (EM-signal distorters present). Additionally, the positional distortion in multiple sensors resulting from the distorting effects of the brachytherapy operating room was characterized.

Results: The robotic validation of the EM system yielded a mean

accuracy of < 0.5 mm for a clinically acceptable field of view in a non-EM-distorting (laboratory) environment. The largest distortion in sensor signal (30s acquisition at 40 Hz), was associated with the brachytherapy equipment cart placed in the proximity of the EM field generator in the brachytherapy operating room. The achievable system accuracy depended largely on the calibration of the TRUS probe, geometry of the tracked devices relative to the EM field generator, and locations of surrounding clinical equipment. To address the issue of variable accuracy, a robust calibration algorithm was developed and integrated into the workflow. The EM-tracked catheter representations were found to have an accuracy of < 1 mm when compared with TRUS- and CT identified positions, both in the laboratory environment and in the brachytherapy operating room, with the addition of the robust calibration. The proposed mapping technique was also found to improve the workflow efficiency of catheter identification.

Conclusions: The high baseline accuracy of the EM system, the consistent agreement between EM-tracked, TRUS- and CT-identified catheters, and the improved workflow efficiency illustrate the potential value of using EM tracking for catheter mapping in highdose-rate brachytherapy.

SP003.4 - Dosimetric and radiobiological comparison of volumetric modulated arc therapy, high-dose-rate brachytherapy and low-dose-rate permanent seeds implant for localized prostate cancer

Author(s): Ruijie Yang, Junjie Wang

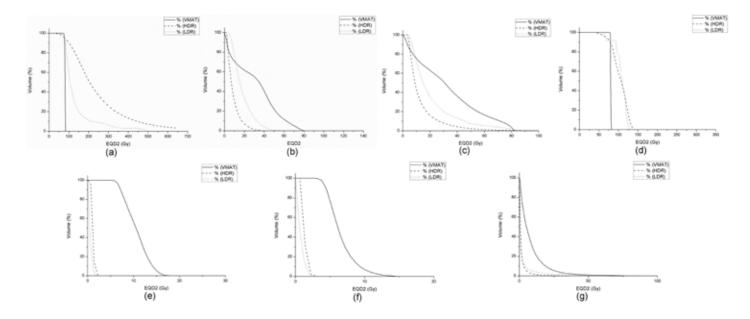

Radiation Oncology, Peking University Third Hospital, Beijing/CHINA

Purpose: To assess the dosimetric and radiobiological differences among volumetric modulated arc therapy (VMAT), high-dose-rate (HDR) brachytherapy, and low-dose-rate (LDR) permanent seeds implant treatment for localized prostate cancer. was D90 of 34 Gy in 8.5 Gy per fraction for HDR (¹⁹²Ir), and 145 Gy to clinical target volume (CTV) for LDR (¹²⁵I) plans, respectively. The dose and dose volume parameters were evaluated for target, organs at risk and normal tissue. Physical dose were converted to dose based on 2-Gy fractions (equivalent dose in 2 Gy per fraction, EQD2) for comparison of three techniques.

Results: HDR and LDR significantly reduced the dose to rectum and bladder compared with VMAT. The Dmean (EQD2) of rectum decreased 22.36 Gy in HDR and 17.01 Gy in LDR from 30.24 Gy in VMAT, respectively. The Dmean (EQD2) of bladder decreased 6.91 Gy in HDR and 2.53 Gy in LDR from 13.46 Gy in VMAT.

For the femoral heads and normal tissue, the mean doses were also significantly reduced in both HDR and LDR compared with VMAT. For the urethra, the mean dose (EQD2) was 80.26 Gy, 91.23 Gy and 104.91 Gy in VMAT, HDR and LDR, respectively.

Conclusion: For localized prostate cancer, both HDR and LDR brachytherapy were clearly superior in terms of the sparing of rectum, bladder, femoral heads and normal tissue compared with VMAT, with a little higher mean dose to the urethra in LDR. HDR provided the advantage in sparing of urethra compared with LDR

Methods and Materials: Ten patients with localized prostate cancer were selected for this study. Volumetric modulated arc therapy, high-dose-rate brachytherapy and low-dose-rate permanent seeds implant plans were created for each patient. For volumetric modulated arc therapy, planning target volume (PTV) was created by adding a margin of 5 mm to the clinical target volume. Rectum, bladder, urethra and femoral heads were considered as organs at risk. 78 Gy in 39 fractions were prescribed for PTV. The dose prescription

SP003.5 - A novel system for real-time planning and guidance of breast HDR brachytherapy

Author(s): <u>Eric Poulin</u>¹, Lori Gardi², Kevin Barker², Jacques Montreuil², Jean Pouliot³, Aaron Fenster², Luc Beaulieu¹ ¹Radio-oncologie, CHU de Quebec, Quebec/QC/CANADA, ²Imaging Research Laboratories, Robarts Research Institute, London/ ON/CANADA, ³Radiation Oncology, University of California San Francisco, San Francisco/CA/UNITED STATES OF AMERICA

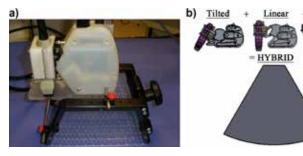

Purpose: In breast interstitial high dose rate (HDR) brachytherapy, the number and positions of the catheters are usually chosen manually using a preimplant CT scan or fixed using 2D ultrasound. Furthermore, there is currently no automated real-time ultrasound guidance system available. In this work, we present a novel system for real-time planning and guidance of breast HDR brachytherapy treatment, using 3DUS.

Methods: A computer controlled robotic 3DUS scanner has been designed to fit on a modified Kuske assembly (Elekta Brachytherapy, Veneendal, The Netherlands). The scanner can be mounted at several positions on the assembly, which allows the user to personalized the position of acquisition, as shown in Fig. 1a. Figure 1b shows the larger field-of-view provided by the hybrid motion of the new 3DUS system. Software modules were developed for the acquisition and reconstruction of ultrasound images. A semi-automatic segmentation algorithm and a needle reconstruction algorithm were integrated into the software to segment the planning target volume and reconstruct the catheters. A tracking module and a catheter optimization algorithm were developed in order to perform real-time planning and guidance of the needle. Linearity, volume and catheter trajectory measurements were performed, using agarose-based phantoms in MRI, CT or 3DUS scanners to validate the new 3DUS system. A new approach, using the template, was used for real-time planning. The method snaps the optimized catheter positions to the available position within the template. The procedure was tested with 14 and 16 catheters, six times each, in an agarose-based phantom with an hypo-echoic mass.

Results: The 3DUS acquisition time requires approximately 20s and the catheter optimization algorithm can obtain 10 complete treatments plans, with the corresponding dosimetric indices, in 90s. There were respectively 3.4 % and 1.4 % difference between MRI/3DUS as well as CT/3DUS volume. Both MRI and CT volume were not statistically significantly different from 3DUS volume (Student *t*-test; *p*>0.05). The 3DUS system was found to measure efficiently the linear dimensions. The mean angular separation distance between catheter trajectories segmented from 3DUS and CT images was $0.42 \pm 0.24^\circ$, while the mean trajectory separation was 0.37 ± 0.17 mm. After the insertion procedure, the real-time approach was shown to enable reduction of the number of catheters without breaking ABS dosimetric recommendations.

Conclusions: A novel system was designed and validated for realtime planning and guidance of breast HDR brachytherapy treatment. A modified system could also be used for permanent breast brachytherapy.

Tilted

approach for spatial reconstruction of implant geometry in high dose rate brachytherapy of prostate cancer Author(s): Stephen Macgregor¹, Chandra P. Joshi¹, Andras Lasso², Carey Shenfield¹, <u>Gabor Fichtinger²</u>, L John Schreiner¹ ¹Departments Of Physics And Oncology, Queen's University, Kingston/ON/CANADA, ²School of Computing, Queen's University, Kingston/ON/CANADA

SP003.6 - Investigation of electromagnetic catheter tracking

Introduction: An accurate and rapid spatial reconstruction of implanted catheters in planning image space is vital in the high dose rate (HDR) brachytherapy. This work investigates the accuracy of electromagnetic (EM) catheter tracking for CT-based treatment planning of HDR brachytherapy of prostate cancer.

Methods: A 16-catheter implant was performed under ultrasound guidance on a tissue-equivalent prostate phantom (Model-053G, CIRS, Norfolk, VA) embedded into a pelvic phantom (Figure 1). Seven PinPoint-128 markers (Beekley, Bristol, CT) on the phantom were used to achieve ground-truth registration between the CT image (2mm slices) and EM tracking space. EM tracking was performed with driveBAY magnetic field generator, and Model-600 (reference) and Model-55 (tracking) EM sensors (Ascension Technology. Shelburne, VT). The EM sensor was inserted sequentially into the catheters to obtain location measurements. Data collection was completed using Plus (www.plustoolkit.org) and SlicerIGT (www. SlicerIGT.org) software, and analyzed in MATLAB. EM tracking was performed at field generator-to-surface distances of 5.5cm and 8.0cm for ultrasound probe inside and withdrawn from the rectum. Catheter tracks were reconstructed from locations measured in EM tracking, and catheter reconstruction error was computed as the shortest distance between the EM tracked points and the catheter centrelines reconstructed with spline curve fitting from the CT image space.

Results and Conclusions: Both ground-truth registration and catheter reconstruction were more accurate closer to the field generator, and when the ultrasound probe was withdrawn from the rectum (Table 1). With the probe withdrawn, the sum of RMS errors was less than the catheter diameter and is clinically acceptable. Large range values indicate presence of tracking outliers due to EM tracking inaccuracies in dynamic noise environment (Table 1). These outliers will be eliminated by using extended Kalman filters combining geometric and kinematic constraints; currently a work in progress.

SP003.7 - Endoscopic Tracking for improved Applicator Insertion in Esophagus and Lung HDR Brachytherapy

Author(s): <u>Robert A. Weersink</u>¹, Jimmy Qiu², Rebecca Wong¹, Gail Darling³, Jonathon Irish³, David A. Jaffray¹

¹Radiation Onclogy, University Health Network, Toronto/ON/ CANADA, ²Techna Institute, University Health Network, Toronto/ CANADA, ³Surgical Oncology, University Health Network, Toronto/ CANADA

Intracavitary applicators are used in high dose rate brachytherapy for lung, esophagus and gynecological applications. For lung and esophagus applications, the linear applicators are typically inserted using a combination of endoscopy and fluoroscopy. In the current procedure, endoscopy is used to define the proximal and distal ends of the planned target length. With the endoscope located at these sites, the endoscope and a surface marker are aligned using fluoroscopic imaging. Applicator insertion follows removal of the endoscope, with fluoroscopy guiding placement of the applicator relative to the surface marker. Since visualization is only twodimensional, applicator placement is prone to error. Furthermore, it exposes staff to unnecessary radiation exposure.

We are developing a new method of applicator insertion that employs tracking and navigation of the endoscope and brachytherapy applicator. The objective is to accurately place the applicator based on direct localization of the endoscopic findings. An electromagnetic tracking device (Aurora, NDI, Waterloo, ON) is fixed inside a standard 8mm diameter flexible endoscope (Olympus). The tracking device measures both position and orientation of the end of the flexible endoscope.

Software developed in-house simultaneously displays and records the coordinates and video stream of the endoscope. If a prior volumetric image has been acquired, the endoscopic recording can be further registered to this image. When the endoscope is at a position of interest, such as the proximal or distal end of the target, the location can be recorded and displayed simultaneously with the position of the endoscope. Multiple points can be recorded. A second tracking device is inserted into the applicator to allow tracking of the coordinates of the applicator. As the applicator is inserted into the esophagus or lung, the previously recorded video is replayed by displaying the closest frame associated with the tracking coordinates of the applicator. The distance of the applicator to the previously recorded points of interest is also displayed as an aid in positioning the applicator. Hence two checks provide confirmation of correct applicator placement: distance to the points of interest and the video frame associated with the location.

We report our initial clinical testing of this technique on patients with esophageal cancer treated with high dose rate brachytherapy. Feasibility and workflow based on physician and therapist feedback will be presented. A preliminary assessment of the accuracy of the applicator placement when compared to the current standard of care will also be presented.

SP004 - Quality Assurance: Part 1

TRACK 04: RADIATION ONCOLOGY

SP004.1 - In Vivo EPID Dosimetry Detects Interfraction Errors in 3D-CRT of Rectal Cancer

Author(s): <u>Stefano Peca</u>¹, Derek Brown², Wendy L. Smith¹ ¹Department Of Medical Physics, Tom Baker Cancer Centre, Calgary/AB/CANADA, ²Dept Of Radiation Medicine And Applied Sciences, Moores Cancer Center, UC San Diego, La Jolla/CA/UNITED STATES OF AMERICA

BACKGROUND

In vivo dosimetry can record the delivered dose during radiotherapy, which may be used to trigger adaptive radiotherapy or other user intervention. We demonstrate the use of our in-house *in vivo* electronic portal imaging dosimetry in quantifying interfraction dose variability in rectal cancer.

METHODS

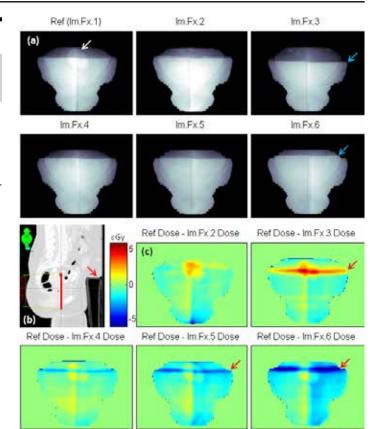

We recorded MV images from nine treatment beams for six patients prone on the belly board, during 4-7 fractions, for a total of 50 measurements. Images were processed with our dosimetry system to produce dose maps. The dose map from the reference fraction was compared to all subsequent ones to determine interfraction delivery variation, yielding 41 dose difference maps.

RESULTS

We identified a number of dose discrepancies. In several patients, persistent gas bubbles may result in cumulative dose deviations large enough to warrant adaptive radiotherapy. In one patient, discrepancies in dose resulted from variability of patient positioning with respect to the belly board (see Figure). In two other patients, dose differences were likely due to variations in compression of the abdomen in the board-couch interface. These issues accumulated significant dose differences throughout treatment and were not readily identified by standard imaging procedures.

CONCLUSION

We are developing an open-source *in vivo* portal dosimetry method to automatically track delivered dose at every fraction. Results can be used to flag unexpected discrepancies, guide adaptive radiotherapy, modify setup technique, or warrant image guidance. Further data is needed to test applicability with other treatment sites and setups.

CAPTION TO FIGURE

Patient F, PA field (GA=0°). (a) Raw EPID images. (b) Lateral view from the TPS showing the imaging plane (red) and the body adapting to the belly board opening. (c) Dose difference maps between the first imaged fraction (Im.Fx.) and five later treatment days. The large horizontal mismatch is located at the edge of the belly board opening (red arrows), indicating inconsistent setup of the patient with respect to the board in the SUP-INF direction. This was verified by visual inspection of the raw images (blue arrows). As well, all dose difference maps are affected by the gas bubble present during the Ref fraction (white arrow).

SP004.2 - Establishing action thresholds for patient anatomy changes and machine errors during complex treatment using EPID and gamma analysis

Author(s): Ophélie Piron¹, Nicolas Varfalvy¹, Louis Archambault² ¹Departement De Radio-oncologie, Hotel-Dieu de Quebec - CHU de Quebec, Quebec/QC/CANADA, ²Departement De Physique, De Genie Physique Et D'optique, Universite Laval, Quebec/QC/CANADA

INTRODUCTION

Our long-term objective is to use *in vivo* data from daily EPID images to identify patients at risk of deviating from their planned treatment. To achieve this, a gamma analysis is performed relative to a reference fraction. The specific objectives of this work are (1) evaluate the sensitivity for different types of error and (2) evaluate the impact of the treatment modality (step-and-shoot IMRT versus VMAT) on the results.

METHODS AND MATERIALS

A homemade head-and-neck phantom was used for all irradiations. A CT scan of the phantom was acquired and clinical treatment plans were applied to it. Errors were introduced and EPID images were acquired. Analysis is performed using the gamma index (3%/3 mm) relative to a no-error delivery. The fraction of points above certain thresholds and the average gamma value is recorded in every case. Daily reproducibility was also assessed by repeating measurements 5 times.

RESULTS

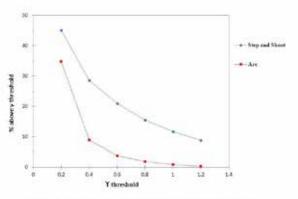

Figure 1: Gamma analysis for using a uniform sheet of 1.5 cm bolus

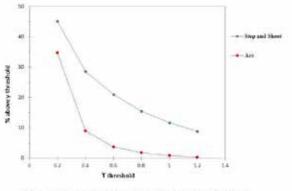

Figure 1: Gamma analysis for using a uniform sheet of 1.5 cm bolus

The errors introduced included: patient positioning, weight losses using a uniform sheet of bolus and leaf errors. Figure 1 and 2 show the fraction of points beyond certain gamma values for patient related errors for both VMAT and IMRT cases. From these figures, it is clear that for similar errors EPID images of arc-based treatments are less perturbed than for step-and-shoot IMRT. Similar results were obtained for errors of different magnitudes. When no error is inserted, 99.4% of pixels have a gamma index below 1 on average using a 1%/1 mm criterion.

CONCLUSION

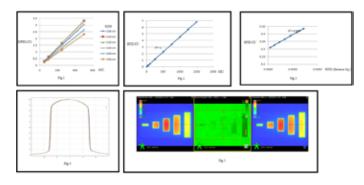

A wide range of errors was introduced to test the sensitivity of EPID to detect treatment errors. For identical errors, those introduced in IMRT treatments were easier to detect than those introduced in VMAT. This will serve to established personalized action threshold to identify patients at risk of deviating from their planned treatment.

SP004.3 - Dosimetrical characteristics of amorphous silicon electronic portal imager for flattening filter free (FFF) photon beam of upgraded C-series Linear accelerator Author(s): Gandhi Arun¹, <u>Vellian Subramani</u>², Shanmugam Thirumalai Swamy¹, Murugesan Kathirvel¹, V.S Subramanian¹ ¹Radiation Oncology, Yashoda Hospital, Hyderabad/INDIA, ²Radiation Oncology, All India Institute of Medical Sciences, New Delhi/ INDIA

Aim: To study the dosimetrical characteristics of amorphous silicon electronic portal imaging system for flattening filter free photon beam of upgraded C-series linear accelerator.

Methods and Materials: Recently our C-series linear accelerator was upgraded to deliver 6MV flattening filter free(FFF) photon beam with the highest dose rate of 1400MU/Min. In this study, we measured and analysed the dosimetrical characteristics of amorphous silicon electronic portal imaging device(aS-EPID) for FFF beam in terms of detector saturation, MU linearity, instantaneous dose rate response, ghosting effect, gantry rotational stability and accuracy of portal dose prediction algorithm. We used indirect method to predict the portal dose images of FFF beam in Eclipse Treatment planning system since the TPS will not allow direct prediction of FFF beam. Pre-treatment quality assurance(QA) using portal dosimetry for IMRT, VMAT and SRS techniques were performed for 30 patients planned with FFF beam. Portal images were acquired at Source to Detector Distance (SDD) of 150cm to evade the saturation issue at high dose rates. Portal dosimetry calibration was done in SRS mode by altering the dose rate to 1400MU/Min at 150cm with the routine beam profile correction and dose normalization. Pre-treatment QA analysis was done using gamma evaluation method.

Results: The aS-EPID saturates at 100cm to 120cm SDD and resolved more than 130cm SDD (Fig.1). The squared correlation coefficient for MU linearity was found R²=1(Fig.2). Instantaneous dose response for different SDD (corrected for inverse square law) was found R²=0.999 (Fig.3). Short term reproducibility for 10X10cm² field size was measured and found to be within 0.5% (Fig.4). Portal images of different standard test pattern were acquired to analyse the accuracy of portal dose prediction algorithm in TPS and the gamma agreement index (GAI) were (98.7±0.5) (Fig.5) for 3% dose difference(DD) and 3mm distance to agreement(DTA) criteria .The ghosting signal was measured and found to be 0.6% higher than reference signal. The results of pre-treatment QA, GAI for 3% DD and 3mm DTA criteria for IMRT, VMAT, SRS were (98.7±1.2)%, (98.1±1.1)% and (99.1±0.7)% respectively.

Conclusion: The study was performed to analyze the dosimetrical characteristics of aS-EPID and results demonstrates that aS-EPID can be used to measure the portal dose images of FFF beam . For fast, accurate and its high spatial resolution, aS-EPID can be used as a verification tool for FFF beam.

SP004.4 - Radiation field size, junction and MLC QA using amorphous silicon electronic portal imaging device, an efficient approach to improve routine accuracy Author(s): Dany Simard, Karim Zerouali

Département De Radio-oncologie, CHUM - Hôpital Notre-Dame, Montréal/CANADA

Introduction: Films have been used for linac QA as a reference 2D detector, but amorphous silicon electronic portal imaging device (EPID) are getting increasingly used for this task even if they offer much lower resolution. EPID is a standard component of modern linacs and it can be used to accelerate QA process. We developed in-house QA tools using EPID to replace films with the objectives of being more efficient, more reproducible, precise, Varian/Elekta compatible and integrated with the QC program database QAtrack+.

Method: We designed a phantom to identify beam crosshair on the images with four 5mm diameter truss head screws 4cm apart from the center. The crosshair is marked over 34cm to achieve precise phantom alignment. 10x10cm² and 30x30cm² field limits are also marked with dashed lines to ease jaw projections visualization. Line thickness corresponds to our test tolerances for quick inspection. Our mechanical technician manufactured three high precision copies with a 2D router.

We developed Matlab[®] EPID image analysis tools to perform fully automatic processing and recording in QAtrack+. We implemented functions that allow accuracy beyond the detector resolution for screw and edge detection. Screws are identified using an image correlation with a screw model followed by a circular Hough transform. An oversampling technique is used to enhance edges detections precision. Distances between screws detected are used to evaluate the magnification factor of the phantom on the detector.

Radiation size QA phantom allows light field check (30x30cm²), light/ radiation field coincidence (10x10cm²) and radiation field verification (other field sizes).

Junction QA does not require the phantom. Images are integrated over 20MU to remove any effects of beam stabilization on this oversensitive test (Typical edge gradient of 3% / 0.1mm). Four quarter fields are delivered on the portal imager, by moving the jaws, and then summed to get one junction image. Profiles across the four junctions are analyzed to determine the percentage of local dose variation.

MLC positioning QA consists of portal images acquired for different field sizes collimated with the leaves. To get all MLCs over a 40 cm field at isocenter, two half-blocked images are acquired with opposite EPID lateral translation.

Results: For all phantoms, distances of 80.08±0.07mm between screws have been measured with a digital caliper. Magnification factor accuracy of 0.2% has been attested by comparing EPID and film profiles acquired simultaneously. Radiation size QA with EPID was compared with film QA and an average absolute difference of 0.3mm have been observed on jaws opening. Using EPID, we are able to reproduce measurements within a standard deviation of only 0.2mm, 3 times lower than film. Similar reproducibility gain is observed for monthly clinical measurement. An average absolute difference of 0.3mm has also been observed between MLC positioning QA with EPID and film QA.

Conclusion: We demonstrated that our in-house QA using EPID achieves our **objectives:** efficiency, reproducibility, precision, compatibility and integration. We replaced films for regular QA and we are working to develop new tests using EPID technology to enhance our QA program.

SP004.6 - Real-time detection of deviations in radiotherapy beam delivery using a head-mounted detector Author(s): <u>Richard Canters</u>¹, Martijn Kusters¹, Juergen Oellig², Juan-Pablo Carrasco², Henk Huizenga¹ ¹Radiotherapy, Radboud UMC, Nijmegen/NETHERLANDS, ²iRT Systems GmbH, Koblenz/GERMANY

Purpose: Correct delivery of the planned treatment is of vital importance in radiation therapy. To be able to monitor beam delivery online, the Integral Quality Monitor (IQM, iRT Systems GmbH) was developed. Mounted on the linac head it enables real-time, per-segment evaluation of the delivered beam. In this study we tested the sensitivity for potential errors in a variety of beams on an Elekta linac with MLCi2 head as a beta test in the last development stage.

Methods: We incorporated various forced deviations/errors in four treatment plans (stereotactic lung, lung (VMAT), larynx (VMAT), and head & neck (IMRT)):

An unintentionally performed re-optimization of the beams after plan approval by the radiation oncologist

Incorrect number of monitor units (MU) in two segments of 10, 5, or 2 MU. The beam MU remained the same.

Incorrect leave positioning (retraction of leaves by 1, 0.5, or 0.2 cm) in a single segment.

The clinical beams, without incorporated errors, are used as a reference.

For VMAT beams, we have chosen to smooth the IQM signal over the segments with a Gaussian filter to account for the exact segment timing. Evaluation takes place on the maximum difference in a segment and in the cumulative signal, with respect to the clinical beam. Additionally, the clinical beams were measured repeatedly to take into account machine variations.

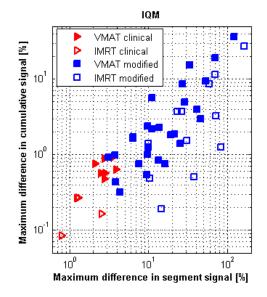

As a comparison, all beams are additionally measured with the Delta⁴ system (Scandidos), the standard QA tool in our department. Analogously to the IQM measurements, the clinical beams are used as references. Median dose difference (DD50) and 95% dose difference (DD95) are assessed as measures of agreement between the beams.

A receiver-operating characteristic (ROC) curve is created by varying the cut-off criterion for error detection to assess the sensitivity and specificity of error detection

Results: In figure 1, the results of the IQM and Delta⁴ system measurements are plotted. The left graph shows the IQM results, where modified beams can be clearly distinguished from reference beams. In the Delta⁴measurements (middle graph) this effect is less pronounced.

This is confirmed by the ROC-curve (right graph), which shows an improved sensitivity and specificity for error detection by the IQM system compared to the Delta⁴ system.

Conclusions: Our tests of the IQM system on the MLCi2 linac show an excellent sensitivity and specificity in error detection during beam delivery, even for very small deviations in a single segment.

SP005 - Patient Specific QA

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP005.1 - Verifying dynamic planning in gamma knife radiosurgery using gel dosimetry

Author(s): <u>Gopishankar Natanasabapathi</u>¹, Subbiah Vivekanandhan², Ss Kale¹, G K. Rath³, R K. Bisht¹, P Agarwal³, P Sathiaraj⁴, B S. Sharma¹

¹Gamma Knife Unit, All India Institute of Medical Sciences, New Delhi/INDIA, ²Neurosciences Centre, All India Institute of Medical Sciences, New Delhi/INDIA, ³Radiation Oncology, All India Institute of Medical Sciences, NEW DELHI/INDIA, ⁴VIT, VELLORE/INDIA

Purpose: To assess dynamic planning based on convolution based algorithm (CABP) in Gamma Knife using gel dosimetry. Materials and Methods: PAGAT gel was prepared and filled into cylindrical container of size 8 cm in diameter for verification. An old MRI distortion phantom was modified to accommodate the gel cylinder. Advantage of this modification is that it avoids the use of metal post and pins in the vicinity of the dosimeter which causes artifacts while scanning. A X-ray CT scan was done on the phantom with cylinder positioned in the middle region. CT scanning parameters were: Tube Voltage – 120 KVp,, Tube Current – 57 mAs, Slice thickness – 1.0 mm, FOV - 265 x 265 mm2. A treatment plan was generated in Leksell Gamma Plan TPS (LGP version 10.1) using CT images of the gel phantom. Using HU values and Electron density information CABP was activated. A single shot plan with third level dynamic planning option was generated using CABPMRI with following parameters were used for scanning: CPMG sequence with 8 TE values, FOV - 256, Matrix size - 256, TR - 5000 ms, slice thickness - 1.2 mm.

Results: Gamma analysis of the verification showed a pass rate of more than 83 %. This is the first kind of study for three dimensional verification of dynamic planning using convolution algorithm in Gamma Knife Perfexion. Conclusion: We propose gel dosimetry as an essential dosimeter for verifying convolution algorithm in Gamma Knife. Further experiments required to validate the verification with close agreement.

SP005.2 - Influence of Jaw Tracking in Intensity Modulated and Volumetric Modulated Arc Radiotherapy for Head and Neck Cancers – A Dosimetric Study

Author(s): Karthick Raj Mani¹, <u>Kh Anamul Haque</u>², Mohammad Anisuzzaman Bhuiyan¹, Koilpillai Joseph Mariadas³ ¹Radiation Oncology, United Hospital, Dhaka/BANGLADESH, ²Radiation Oncology Unit, United Hospital, Dhaka/BANGLADESH, ³Department Of Radiotherapy, Sanjay Gandhi Postgraduate Institute of Medical Sciences, Lucknow/INDIA

Aim:

To Study the dosimetric advantage of the Jaw tracking technique in Intensity Modulated Radiotherapy (IMRT) and Volumetric Modulated Arc Therapy (VMAT) for Head and Neck Cancers.

Materials & Methods:

We retrospectively selected ten previously treated Head and Neck cancer patients stage (T1/T2, N1, M0) in this study. All the patients were planned for IMRT and VMAT with Simultaneous Integrated Boost (SIB) technique to deliver a differential dose per fraction to the high, intermediate and low risk volume using a single plan. We intend to deliver 70Gy to the high risk volume, 64Gy to the intermediate risk volume and 56Gy to the low risk volumes in 35 fractions. All

the critical structures were delineated which includes both parotids, spinal cord and both sub mandibular glands. Eclipse treatment planning system, version 11.0 (Varian Medical Systems, Palo Alto, CA), was used in this study. All the plans were planned with 6MV photons using Millennium 120 MLC. Both IMRT and VMAT plans were planned with and without jaw tracking by keeping the same constraints and priorities for the target volumes and critical structures for a particular patient. Plans were normalized at the target mean of the high risk volumes. All the plans were accepted with the criteria of parotid glands mean dose <25Gy and spinal cord maximum point dose <45Gy without compromising the target volumes. Target conformity, dose to the critical structures and low dose volumes were recorded and analyzed for IMRT and VMAT plans with and without jaw tracking for all the patients.

Results & Discussion:

Jaw tracking resulted in decreased dose to critical structures in IMRT and VMAT plans. But significant dose reductions were observed for critical structure in the IMRT Technique with jaw tracking compared to IMRT Technique without jaw tracking. In VMAT with jaw tracking technique the dose reduction to the critical structure were not significant compared to the without jaw tracking technique due to relatively lesser monitor units. Gamma analysis showed greater than 97% of pixels were passed within 3mm distance and 3% dose criteria for all the plans.

SP005.3 - Evaluation of the eye lens dose according to patient setup errors in pediatric head CT examination

Author(s): <u>Rumi Gotanda</u>¹, Toshizo Katsuda², Tatsuhiro Gotanda³, Kazuki Noguchi⁴, Erika Nakajima⁴, Takuya Akagawa⁵, Nobuyoshi Tanki⁵, Tadao Kuwano⁶, Tetsunori Shimono³, Yasuyuki Kawaji³, Hitoshi Sato⁴, Yoshihiro Takeda⁵

¹Department Of Radiological Sciences, Ibaraki Prefectural University of Health Sciences, Inashiki-gun, Ibaraki/JAPAN, ²Department Of Human Relation, Tokai Gakuin University, Gifu/JAPAN, ³Department Of Radiological Science, Faculty Of Health Sciences, Junshin Gakuen University, Fukuoka/JAPAN, ⁴Department Of Radiological Sciences, Ibaraki Prefectural University of Health Sciences, Ibaraki/ JAPAN, ⁵Graduate School Of Health Sciences, Okayama University, Okayama/JAPAN, ⁶Osaka Center for Cancer and Cardiovascular Diseases Prevention, Osaka/JAPAN

According to the 2011 ICRP statement, the threshold in absorbed dose for the lens of the eye is now considered to be 0.5 Gy. Therefore, it is important to keep the eye lens doses during head computed tomography examination as low as reasonably achievable. In preliminary study, the surface doses became smaller with decreasing distance from the X-ray tube. Therefore, decreasing the distance from the lens to the X-ray tube (i.e. raising the bed position) is a simple and effective way to reduce the absorbed dose of the lens. However, the occiput doses became higher with increasing distance from the X-ray tube. In this study, the two lenses and the occiput doses associated with patient setup errors and head size were evaluated using phantoms developed for pediatric patients. The phantoms were made using flexible acrylic sheets in a cylindrical shape [diameters of 6 (premature baby), 8 (neonate), 10 (infant), and 12 cm (child)] and placed on the end of the CT bed. The bed position was raised from the center for each phantom size. The two lenses and the occiput doses at each setup were measured using radiochromic film. By raising the bed position, the two lenses doses decreased at all phantom sizes. However, the occiput doses changed in a complex manner according to the phantom size. The absorbed dose ratio of the two lenses and the occiput at $\phi 8$ cm phantom are shown in Fig. 1. In this study, raising the bed position is an effective way to reduce the absorbed dose of the lens. However, when the occiput was positioned at the center of the gantry aperture, the occiput dose peaked in all phantom sizes. In addition,

the results indicated a complex dose distribution in pediatric head CT when taking into account the bed position (patient setup errors) and phantom sizes. Furthermore, beam slice width and pitch are important factor in determining the maximum absorbed dose. To keep radiation doses during CT examination as low as reasonably achievable, it is important to clarify the influence of CT scanning settings on CT dose.

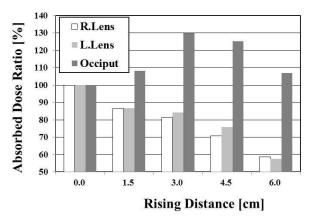

Fig. 1. Absorbed dose ratio at φ8 cm phantom.

SP005.4 - Multi-Point Sources on Skin to Assess the Annual Effective Dose by Usage of TENORM added Pillow

Author(s): <u>Do Hyeon Yoo</u>¹, Wook-Geun Shin¹, Jae Kook Lee², Yeon Soo Yeom³, Chan Hyeong Kim³, Chul Hee Min¹

¹Department Of Radiation Convergence Engineering, Yonsei University, Wonju/KOREA, ²Korea Institute of Nuclear Safety, Daejeon/KOREA, ³Department Of Nuclear Engineering, Hanyang University, Seoul/KOREA

Consumer products containing Technically Enhanced Naturally Occurring Radioactive Material (TENORM) has been distributed in our life. After the accident of Fukushima nuclear power plant, the law called as 'Act on Safety Control of Radioactive Rays around Living Environment' has been implemented to prevent the unnecessary radiation exposure to the public in KOREA. However, the appropriate method to effectively evaluate the exposed dose with TENORM added consumer product was not developed despite the law was into effect from July 2012. The aim of this study is to evaluate the exposed dose with the usage of TENORM added consumer product with Monte Carlo simulation. To assess the annual effective dose, the Monte Carlo method and computational human phantom was employed and the point source on the skin was suggested to effectively determine the various product shape and location.

For the assessment of effective dose with the radionuclide in a consumer product, Polygon-Surface Reference Korean-Man (PSRK-Man) phantom composed of high resolution polygons to represent the organs was developed. To represent the source location of the radioactive material in the product, polygons on skin under the product was selected and the source was generated in the weight center in each polygon. To validate the method defining the point sources on skin later than the realistic source distribution in the product shape and location, organ dose was compared with 1 MeV gammas isotropically emitted in the assumption of the pillow usage with Monte Carlo method using Geant4 tool kits.

Our simulation study shows that the multi-point sources defined on the skin indicate the conservative dose assessment than the sources in the product being modeled because of the close source definition to organs. For bone, skin, and muscle, the organ dose using modeling source was, however, higher than the point source with the increased effective angles. This indicates that increasing the source to organs distributed through the whole body distance could decrease the self-attenuation by other organs. The effective dose with the point source and modeled source was assessed as $5.56E^{-17}$ Sv/particle and 2.97E⁻¹⁷ Sv/particle, respectively.

The current study shows the potential method for the evaluation of effective dose by the TENORM added products by using the Monte Carlo method. The comparison study also showed that the various shape and usage location of products could be replaced with the point source on the skin. The data based for the exposed dose by whole the point source could enable the effective and convenient assessment of annual effective dose. This technique could also be used for the other field for radiation protection to calculate the effective dose.

SP005.5 - Patient-Specific Quality Assurance of Respiratory-Gated VMAT Using a Programmable Cylindrical Respiratory Motion Insert for the ArcCHECKTM Phantom

Author(s): <u>Heather Young</u>¹, Kevin J. Jordan², Stewart Gaede² ¹Engineering, University of Waterloo, Waterloo/CANADA, ²Department Of Medical Biophysics, Western University, London/ON/ CANADA

Introduction: The ArcCHECK[™] phantom is a commonly used fourdimensional detector array for dose delivery verification of IMRT and VMAT. Although the isotropy of this device bodes well for ensuring accuracy for entrance dosimetry per control point, the composite 3D dose distribution may not be accurately represented for tumour sites influenced by respiratory motion. Motion management strategies, such as gating, often requires additional procedures and equipment to ensure accurate delivery. Here, we present a customized programmable moving insert for the ArcCHECK[™] phantom that, in a single delivery, can verify both entrance dosimetry, while simultaneously verifying the delivery of respiratory-gated VMAT.

Methods: The QUASAR[™] Cylindrical Respiratory Motion Phantom consists of a computer-controlled stepper motor used to move interchangeable cylindrical inserts inside a stationary sleeve placed within the bore of the ArcCHECK[™] phantom (Figure 1). To demonstrate its effectiveness for patient specific QA, 4D-CT scans of 8 early-stage lung cancer patients previously treated with gated SBRT were used to characterize the tumour motion and was inputted into the programmable software used to drive an A1SL ion chamber insert. CT images of the ArcCHECK[™] with the programmable insert were acquired at multiple static positions in 1mm increments.

Respiratory-gated VMAT plans were recalculated on the phantom scan corresponding to the amplitude of the tumour motion measured with 4D-CT. Each plan was delivered under static, moving (while non-gated), and moving (while gated) conditions. For each patient, standard ArcCHECK[™] measurements were compared to the planned dose distributions using SNC Patient 6 software using standard gamma analysis with 5% threshold, 3% dose-difference, and 3mm distance-to-agreement and the measured dose to the A1SL chamber, located at isocentre, was compared to the planned dose.

Results: The pass rate for the static delivery ranged from 98.1% to 99.6%, suggesting a valid phantom setup for entrance dosimetry. The pass rate was not altered for any measurement delivered under motion conditions. A similar result was observed under gated VMAT conditions containing multiple beam holds and dose-rate ramp-up and ramp-down. For six patients, the measured dose to the A1SL ion chamber was within 3% of the planned dose. The maximum dose difference was 5.1% in one patient where the chamber was located in a large dose gradient.

Conclusions: Patient-specific respiratory-gated VMAT verification can be efficiently performed in a single delivery with the ArcCHECK-[™] phantom containing a moving cylindrical insert.

Figure 1. The QUASAR[™] Cylindrical Motion Insert (with A1SL chamber) for the ArcCHECK[™] phantom.

SP006 - Dosimetry in CT

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP006.1 - Dosimetry and Radiation Protection Author(s): <u>Virginia Tsapakis</u>

Konstantopoulio General Hospital, Athens/GREECE

It is an actual fact that the primary and most common application of radiation until today is in medicine. Furthermore, medical technology has taken a remarkable boost the last few decades both in patient therapy and medical diagnosis. Not only do we have a big variety of medical equipment but we can access all patient data so much easier than 10 or 20 years ago that is really spectacular. Evolution led us so quickly from soft copy to CD-ROM and now icloud that we sometimes ask ourselves how it was possible to work as we did 5 or 10 years ago. All this has resulted not only on a manifest increase in the number of procedures, but also an expansion into different areas of medicine and the creation of new medical specialities. Presently, complex radiation-based tools and techniques are used in most areas of modern medicine and by specialists who have differing levels of knowledge about radiation, dose and the risks posed to human health by ionising radiation.

Within this context, it is very important to use medical radiation technology with prodigious care due to the presence of ionizing radiation. To put the issue in perspective, the current annual collective dose estimate from medical exposure in the United States has been calculated as roughly equivalent to the total worldwide collective dose generated by the nuclear catastrophe at Chernobyl. Therefore accurate measurement of radiation dose is of utmost importance, not only for patients but also for members of the staff, specially due to the recent International Commission on Radiological Protection reduction in the dose limit for the eye lens of workers (from 150 mSv per year to 20 mSv in a year).

Dosimetry seems to play a fundamental role in the process of developing various radiation protection programs to fit the needs of radiation workers and members of the public, particularly as they relate to mitigating potential health risks from exposure to radiation. Specially due to the fact that there is broad discussion the last years on the possibility that radiation dose received by patients from modern diagnostic examinations can be at a level of significance for the induction of cancer across a population. Moreover, in a number of cases, in the acute damage to particular body organs such as skin and eyes.

The talk will cover the trends in dosimetry and radiation protection focused in diagnostic radiology, image-guided interventional procedures and nuclear medicine studies, illustrated by progress in science and practice of risk communication and changes in societal expectations, and examines challenges that will confront radiation risk communication in the future.

SP006.2 - Organ dose reduction while using in-house CBCT patient-specific protocols based on OSL dosimetry.

Author(s): Étienne Létourneau¹, Fabiola Vallejo¹, Nancy El Bared², Danny Duplan¹, Martin Hinse¹

¹Radio-oncologie, Centre intégré de cancérologie de Laval, Laval/ CANADA, ²Université de Montréal, Montréal/CANADA

Purpose/Objectives

In radiation therapy, dose contributions coming from planning and

patient positioning images can seem negligible compared to the treatment dose. However, radiation-induced complications are numerous even at low dose. In order to diminish undesirable effects to the patient, one must concretely apply the ALARA principle and minimize dose to organs at risk (OAR) while not compromising treatment quality. In this study, appropriate adjustments to cone beam computed tomography (CBCT) imaging protocol parameters were performed. This was achieved after measuring the dose to organs in an anthropomorphic phantom filled with optically stimulated luminescent detectors (OSL). All these modifications lead to a significant dose reduction of at least 50% up to a reduction of 90% in comparison with the default protocol doses while still preserving a proper image quality for positioning.

Materials/Methods

Output measurements of the CBCT X-ray tube were performed at 100 kVp and 120 kVp. Measurements were based on the AAPM Task Group 61 protocol using a Farmer-type ionization chamber calibrated for the corresponding beam quality. Once the outputs were determined at the reference point, the correlation between OSL's number of counts and the resultant dose was achieved. An anthropomorphic adult phantom with heterogeneous densities and 271 plugs for OSL detectors covering the whole body was used. Default scan protocols of the head and neck, breast, chest and pelvis were investigated. The mean dose and the maximum dose to the organs were collected over multiple scans to assure the reproducibility of the given method.

Results

The maximum dose to any given organ never exceeded 3.0 cGy for all the default protocols. For the particular head and neck cases, the maximum dose never reached more than 0.4 cGy. Radio-sensitive organs such as lungs, breasts, bone marrow, stomach and intestines received between 1.0 cGy and 2.0 cGy per scan. In the chest and pelvis protocols, the thyroid gland and the testis received more dose than the other organs (2.0 - 3.0 cGy) due to their proximity to the surface and the low attenuation of the beam before reaching the OSLs.

Conclusions

With the new modifications made to the default scan parameters, a considerable organ dose reduction of at least 50% can be achieved for every protocol without compromising image quality for patient positioning. With our in-house protocols, no organ received more than 1.5cGy per scan. These results are therefore in compliance with the ALARA principle. Also, a new ultra-low dose scanning protocol for the chest was introduced giving only 0.1 cGy to the lungs and 0.2 cGy to the heart and thyroid respectively. This significant dose reduction is desirable especially for young lymphoma patients.

SP006.3 - A novel tool for in vivo dosimetry in diagnostic and interventional radiology using plastic scintillation detectors Author(s): <u>Jonathan Boivin</u>¹, Sam Beddar², Maxime Guillemette³, Luc Beaulieu⁴

¹Département De Radio-oncologie Et Axe Oncologie Du Centre De Recherche Du Chu De Québec, CHU de Quebec, Québec/CAN-ADA, ²University of Texas MD Anderson Cancer Center, Houston/ TX/UNITED STATES OF AMERICA, ³Genie Biomedical, Institut universitaire de cardiologie et de pneumologie de Quebec, Québec/ CANADA, ⁴Département De Physique, Génie Physique Et D'optique, Et Centre De Recherche Sur Le Cancer, Université Laval, Québec/ CANADA

Plastic scintillation dosimetry is now spreading in multiple areas of clinical practice either for quality assurance or in vivo dose monitoring. While many studies have validated this tool for radiotherapy and brachytherapy, applications in the radiology field are being investigated. Various photodetectors can be part of the plastic scintillation detector (PSD) according to the targeted clinical application. However, no study has compared these detectors in the same conditions to identify the best configuration. Moreover, there is a need for extensive characterization of the low energy response of the scintillator's material for radiology purposes.

The objective of this work is to develop and optimize a PSD for real-time dose rate measurement for low energy beams. The PSD is composed of a scintillating fiber coupled to a clear optical fiber transmitting the scintillator's light to a photodetector.

A spectrometer was used to characterize the scintillator's spectrum under low and high energy exposures. Seven photodetectors were then evaluated to identify their operating range and potential applications. They comprise a photomultiplier tube (PMT), an avalanche photodiode, two passive diodes, and a set of three CCD cameras. The scintillator was exposed to low energy potential beams (120 kVp, 180 kVp, and 220 kVp) of an orthovoltage unit and to linear accelerator 6 MV and 23 MV beams. The source-to-detector distance was varied to explore a broad dose rate range likely to be used in radiology, superficial treatment and radiotherapy. Every detector was able to measure dose rate down to 10 mGy/s while keeping a relative standard deviation below 2 %. The CCD cameras were the less sensitive devices, but they allow multiple fibers to be read simultaneously. Among the photodetectors, the PMT was found to be the most sensitive detector with a relative standard deviation of less than 1 % at the lowest dose rate available.

A second study was performed to observe the scintillator energy dependence to AAPM accredited reference beam qualities of a calibration laboratory. The PMT was included in the PSD design and the scintillator's light signal was characterized for energy levels from 20 kVp to 250 kVp. The PSD's response was then analyzed regarding the reference exposure spectra and the NIST mass energy-absorption coefficients.

The PMT PSD was finally included in an in vivo study for interventional radiology where low dose rate sensitivity is essential. The PSD was located inside a plastic water phantom to measure skin and depth dose from 1 mm down to 24 cm. There was less than a 2 % difference between the PSD measured dose rate and the ion chamber reading located at the same depth.

These results indicate that a broad range of photodetectors can be used for PSD designs, but low dose rate measurements require very sensitive devices such as a PMT.

SP006.5 - Assessment of patient's eye lens dose using a custom made anthropomorphic head phantom

Author(s): Mohammad Javad Safari, Jeannie Hsiu Ding Wong, <u>Kwan</u> <u>Hoong Ng</u>, Khairul Azmi Bin Abd Kadir

Biomedical Imaging, University of Malaya, Kuala Lumpur/MALAYSIA

Purpose: To fabricate an anthropomorphic phantom for patient's radiation dose measurement during diagnostic x-ray procedures.

Materials and **Methods:** CT images of head of 13 patients were studied and CT number and physical dimensions of the head components were recorded. A head phantom was custom made based on the CT of an adult male using a 3D printer. The phantom's brain was fabricated using polyacrylamide and the eyeballs and skin were fabricated using VytaFlex®40 polyurethane rubber (Figure 1).

The study of the radiation dose distribution over the phantom's eyeball was carried out using a Philips Allura Xper FD20/20 system (80 kV, 3 fps acquisition mode). Gafchromic XR-RV3 film was used to measure absorbed dose at positions corresponding to the surface of the cornea, under the cornea, under the lens, and on the retina of the eyeball. Result: The custom made phantom has CT numbers that corresponds to the CT numbers of real organs (within 9.0%). The depth dose curve within the eyeball shows a gradual fall off with depth in tissue (Figure 2).

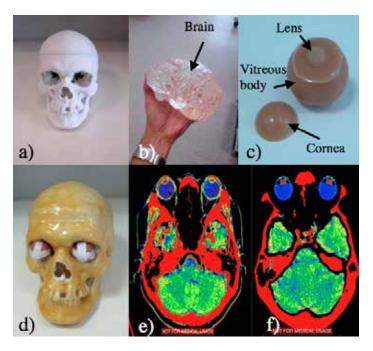

Figure 1 Custom made head phantom, a) 3D printed skull, b) brain, c) eyeball, d) skull covered by polyurethane as skin, e) CT image of patient and f) CT image of the head phantom.

Figure 2 shows the radiation dose at different depths within the phantom eyeballs.

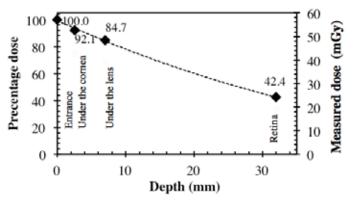

Figure 2 Radiation dose received at different level of the eyeball

Conclusion: A custom made anthropomorphic head phantom was successfully fabricated and used to evaluate eye lens dose during diagnostic fluoroscopy procedures.

SP006.6 - Dose Profile and Equilibrium Doses in CT Author(s): <u>Ricardo A. Terini</u>¹, Maria Carolina S. Campelo², Marcia D.C. Silva³

¹Depto. De Física, Pontifícia Universidade Católica de São Paulo, São Paulo/BRAZIL, ²Curso De Física, Pontifícia Universidade Católica de São Paulo, São Paulo/BRAZIL, ³Física Médica - Engenharia Clínica, Hospital Israelita Albert Einstein, São Paulo/BRAZIL

Introduction: Absorbed dose in CT exams can be ten times higher than in other common procedures of X-ray imaging and must

be monitored. Dosimetry in CT is still commonly made obtaining CTDI100 values, measured with a "pencil" chamber inside a CT phantom, in a single beam slice and no table movement. In helicoidal and multi-slice tomography with high number of rows, measured values of CTDI100 should underestimate accumulated dose at point z=0, as they don't include the contribution of dose profile «tail», caused by scattering in the phantom (or tissue). In this sense, this work aimed to contribute to review the assessment of Dose in CT according to the methodology suggested by AAPM TG 111 [AAPM, Report 111, 2010].

Methodology: Firstly, we have used a Radcal 0.6 cc chamber, previously calibrated in CT standard beam qualities [IAEA, TRS 457, 2007] against a Farmer chamber, to measure dose profiles on a Toshiba Aquilion One scanner (HIAE), through several adjacent slices. Values of Equilibrium Dose free in air, Deq,ar, were obtained for various protocols and pitch values. In the second step, using a large CT phantom (Fig.1), values of central Cumulative Dose (DL(0)) were measured for different scan length values (L), for two different abdomen protocols, in order to evaluate the Equilibrium scanning length (Leq) and Equilibrium doses (Deq) (Fig.2). Finally, Planar Average Equilibrium Dose (Deq,p) was evaluated and compared with CTDIvol values displayed in the CT equipment.

Figure 1 – Setup for the CT clinical measurements using the 0.6 cc chamber and a 450mm phantom.

Results and Discussion: In the survey of dose profiles, slice thickness was evaluated with 19-28% difference compared to the nominal value. It was also observed that Equilibrium Dose free in air increases as the pitch is reduced and that the values of equilibrium dose-pitch product free-in-air (p.DEQ, air) are constant. As expected, differences between Planar Average Equilibrium Dose and CTDIvol ranged between 30-37%.

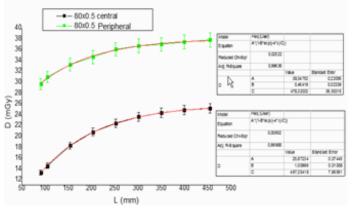

Figure 2 – Approach to equilibrium of central and peripheral axis Cumulative Dose $D_L(0)$, for a beam with 40mm (80x0.5) thickness, in an axial protocol. Red lines are the approximation function to equilibrium

SP007 - Biomedical Signal Quality Analysis

TRACK 09: BIOSIGNAL PROCESSING

SP007.1 - Biosignal Processing

Author(s): Adrian D.C. Chan

Systems And Computer Engineering, Ottawa-carleton Institute For Biomedical Engineering, Carleton University, Ottawa/ON/CANADA

At the end of this presentation you will be able to:

1) explain the need for biomedical signal quality analysis

2) discuss the challenges in biomedical signal quality analysis

3) describe some of the advances in biomedical signal quality analysis

The democratization of technology is being fueled by technology that is decreasing in size, cost, and power-consumption, while the levels of computing power and interconnectivity are increasing. In healthcare, so called patient-empowering, information-leveraging (PI) technologies are drastically changing the paradigm of biomedical monitoring. Traditionally, biomedical monitoring is performed intermittently by a trained expert, under well-controlled conditions, whereas advances has made it easy for frequent or continuous monitoring; in addition, neither the monitoring environment nor the subject's activity is controlled necessarily (e.g., monitoring can be performed in the home while performing normal activities of daily living). These technologies are not only non-invasive but also nonobtrusive; they can be wearable devices, or integrated into other devices or environments where they may remain unnoticed by the subject. Multi-sensor systems are being increasingly employed, some of which are also multi-modal. These systems may use sensors that are each of lower quality and lower cost, and may not be optimized for a given monitoring application; yet these multi-sensor systems may outperform a higher quality and higher cost individual sensor in terms of accuracy, robustness, and convenience. The rapid increase in biomedical monitoring has resulted in a large focus on "big data" in healthcare.

There has been considerable research and development effort in the acquisition of biomedical data and in data analytics to extract useful information from these data. In many acquisition systems, validation of the data in terms of quality typically requires a human. In data analytics, it is often assumed that data are of adequate quality for processing. When data are not of sufficient quality, this can result in erroneous conclusions including false alarms. For the fourth year in a row, the Emergency Care Research Institute (ECRI) identified alarm hazards as the top health technology hazard.

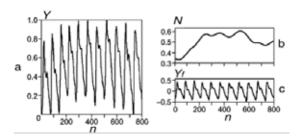

There is a pressing need for increased research on biomedical signal quality analysis. Biomedical signal quality analysis can be organized into four categories: 1) detection, observing the presence of contaminants in the signal, 2) identification, identifying the type of contaminant(s), 3) quantification, estimating the level of contamination, and 4) mitigation, removing or reducing the contamination. In some applications, simple detection may suffice, requiring only the ability to reject poor quality data. For non-expert users, identification of the contaminant type could be useful in providing feedback to remedy the acquisition setup. Biomedical signal quality analysis poses a variety of challenges, including large signal variability (interand intra-subject), contaminants that overlap in time and frequency with the signal of interest, and often a low prevalence of clinically significant events.

SP007.2 - Adaptive filter for eliminating baseline wander of pulse wave signals

Author(s): Aleksandr A. Fedotov, <u>Anna S. Akulova</u> Lasers And Bioengineering Systems, Samara State Aerospace University, Samara/RUSSIAN FEDERATION

Recording and processing of arterial pulse signals are widely used in cardiology instrumental diagnostic systems. The arterial pulse signals are corrupted by physical and physiological interferences. Physiological interferences are happened due to the patient's breathing and the effect of neurohumoral regulation factors and also the presence of low-frequency movement artifacts; these factors lead to the appearance of baseline wander: a nearly periodic low-frequency distortion of random nature. The stochastic nature of baseline drift in biomedical signals and also its broadband nature are the main reasons why new advanced methods should be developed for digital processing of the arterial pulse signal. In this article different baseline wander filtering methods were examined for pulse wave signal. A baseline drift correction method based on generating the reference signal of adaptive filter by using multiresolution wavelet analysis of the original biosignal was proposed. This approach makes it possible to achieve the least distortions in processing pulse wave compared with other methods of eliminating baseline drifts. The effectiveness of proposed method, as well as other widely used approaches for filtering pulse wave signals such as approximation method, linear frequency filtering was studied.

Fig. 1 shows the fragment of arterial pulse signal with typical baseline wander (*a*); obtained estimation of the baseline wander (*b*); the pulse wave signal after application the new method of correction baseline wander proposed in this article (*c*).

SP007.3 - Efficacy of DWT denoising in the removal of power line interference and the effect on morphological distortion of underlying atrial fibrillatory waves in AF-ECG

Author(s): Jonathan Goodfellow¹, <u>Omar J. Escalona¹</u>, Vivek Kodoth², Ganesh Manoharan²

¹Engineering Research Institute, Ulster University, Newtownabbey/ UNITED KINGDOM, ²The Heart Centre, Royal Victoria Hospital, Belfast/UNITED KINGDOM

Introduction: Power line interference (50Hz) is a corruptive noise source which is commonly encountered when capturing body surface ECG signals. The purpose of this research is to assess the efficacy of Discrete Wavelet Transform (DWT) in removing mains noise by testing over thirty different wavelet functions. The four best performing wavelets were then further analysed to assess their effects on underlying fibrillatory waves which are present in atrial fibrillation patients.

Methods: 18 body surface ECG recordings of 1 kHz sampling frequency, which were corrupted by a range of mains interference levels (-10dB to 10dB) were simulated in MATLAB using an ECGSYN programme from PhysioNet. These signals then underwent a DWT denoising process which included 10-level decomposition, with full band cancellation of coefficients D1-D4, resulting in a significant attenuation of the added mains interference. The efficacy of the DWT denoising performance was assessed across the entire range of analysing wavelets and also compared to that of notch filtering, a technique which is widely used for mains interference suppression. The results were quantified and compared using three different performance parameters: Signal to Noise Ratio (SNR). Mean Square Error (MSE) and Signal Correlation Value (SCV). Additionally, we wanted to investigate the effect that the top performing wavelets would have on underlying fibrillatory waves which are present in atrial fibrillation electrocardiogram (AF-ECG), as certain key parameters of such waves have been shown to be useful in the characterisation and treatment of the arrhythmia. Five fibrillatory wave signals were extracted from real AF-ECG data using an average template subtraction method and were added to a range of mains corrupted simulated ECG signals. These signals were denoised using the top four performing wavelets and the underlying fibrillatory wave signal was recovered via the subtraction of the original 'clean' simulated ECG signal. Key parameters such as dominant frequency (DF) and total spectral power (TSP) of both the original and recovered fibrillatory wave signals were guantified and compared in order to assess whether or not the DWT denoising process was detrimental to fibrillatory wave characteristics.

Results: 12 out of 32 of the analysing wavelets tested outperformed a traditional notch filtering approach over all three performance indicators: SNR, MSE and SCV when averaged across the sample population. Four of the top performing wavelets were Daubechies 'Db10', Biorthogonal 'Bior6.8', DMeyer 'Dmey' and Symlet 'Sym8', with Db10 providing SNR, MSE and SCV values of 32.50, 5.13×10^{-5} and 0.9995 respectively. Fibrillatory waves were minimally affected by DWT processing with a 0% difference in DF and a 0.17% \pm 0.25% difference in TSP across the study population.

Conclusions: DWT denoising can be an effective tool in the removal of unwanted 50Hz mains noise, where a range of analysing wavelets provide superior denoising performance when compared to traditional notch filtering. The process of DWT mains noise removal has negligible effects on the morphology or signal characteristics of underlying fibrillatory waves found in AF-ECG signals.

SP007.4 - Quantifying Blood-Oxygen Saturation Measurement Error in Motion Contaminated Pulse Oximetry Signals Author(s): <u>Geoffrey Clarke</u>, Adrian D.C. Chan, Andy Adler Systems And Computer Engineering, Carleton University, Ottawa/ CANADA

Oxygen saturation measurements from pulse oximetry (SpO2) can be unreliable in the presence of motion artifacts. While pulse oximetry is a crucial measurement in controlled environments, such as surgery or intensive care, its vulnerability to motion artifacts has slowed its adoption in wearable continuous monitoring devices. Measurement error can cause errors or delays in clinical decision-making. In remote monitoring applications, pulse oximeters should report measurement confidence along with SpO2 to help clinicians make decisions about the validity of alarm conditions. This paper seeks to relate signal quality to SpO2 measurement confidence.

In this study, clean photoplethysmograph (PPG) signals were collected from a pulse oximeter and contaminated with motion artifact. A range of linear combinations of signal and artifact were generated and SpO2 measurements were calculated. Since true SpO2 remained constant, measurement variation was caused solely by signal contamination. Unacceptably high measurement error was found below the 15-20 dB signal to noise ratio (SNR) range.

Two models based on Additive White Gaussian Noise (AWGN) were evaluated for their similarity to the motion artifact data. The first had identical noise on both red and infrared PPG signals; the second has uncorrelated noise. Both models successfully predicted negative measurement bias at low SNR, but only the second predicted the observed measurement variance.

SP007.5 - Signal Quality Indices for Ambulatory Electrocardiograms used in Myocardial Ischemia Monitoring

Author(s): <u>Mohamed Abdelazez</u>¹, Adrian D.C. Chan¹, Patrick X. Quesnel¹, Homer Yang²

¹Systems And Computer Engineering, Carleton University, Ottawa/ ON/CANADA, ²The Ottawa Hospital, Ottawa/ON/CANADA

Ambulatory electrocardiograms (ECG) can be used to monitor patients for myocardial ischemia. Low ECG signal quality, due to contaminants such as motion artifact, can lead to an increase in false alarms leading to alarm fatigue. The false alarms can be reduced by processing only ECGs of adequate quality, quantified by a signal quality index (SQI); contaminated ECG may be discarded. Four SQIs based on an estimate of the signal-to-noise ratio (SNR) were examined, where the mean, median, 25th percentile and minimum SNR were considered. ECG test data were retrieved from Physionet's Long-Term ST Database; 30 minute segment of ischemic data and 30 minute segment of non-ischemic data were chosen from the record 's20031'. The record is sampled at 250 HZ and has a total of 2 unidentified leads. The SQIs were validated by contaminating 30 second segments of the ECG data with 30 seconds of motion artifact segments scaled at five levels from the record 'em' from the Physionet's Noise Stress Test Database. The result is five copies of each ECG segment each with different calibrated SNR evenly distributed between -10 dB and 10 dB in steps of 5. For each channel of both the non-ischemic and ischemic data of the 's20031' record, 300 segments were created, resulting in a total of 1,200 segments. Four SQIs were then generated for each of these 1,200 segments. The SQIs of each segment were compared to the calibrated SNR of the segment. A Pearson correlation coefficient was calculated between the SQIs and the calibrated SNRs for each of the cases (Fig. 1).

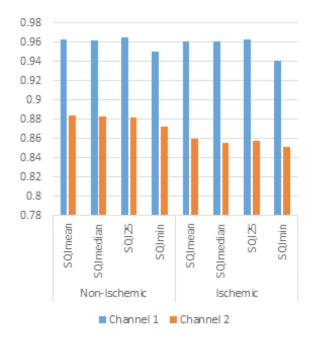

Fig. 1 calculated Pearson correlation coefficient for SQIs and the calibrated SNRs for non-ischemic and ischemic data for channels 1 and 2

It was found that a strong correlation (Pearson correlation coefficient > 0.85) was exhibited between the SQIs and the calibrated SNR for each segment with SQI based on 25th percentile exhibiting highest correlation. The strong correlation indicates that the SQIs are good representatives of signal quality.

SP007.6 - A simple algorithm for identifying artifact beats in long ECG recordings

Author(s): <u>Nini Rao</u>, Yongli Wan, Yang Yang, Ying Zhang, Jie Zhen, Sang Li

Dept. Of Biomedical Engineering, University of Electronic Science and Technology of China, Chengdu/CHINA

Introduction

The artifact beats in ECG recordings make diagnosis and monitoring of heart disease difficult and will increase the misdiagnosis rate. Clinically, it is time-consuming and labor-intensive to identify the artifact beats from long ECG recordings. Thus, there is a great need for developing an algorithm to automatically detect the ECG artifacts.

Data

The simulation data is used to determine the parameters in the algorithm. The independent data is the combinations of real ECGs of normal patients and patients with arrhythmia (such as atrial fibrillation, atrial flutter, ventricular premature beat, etc.) and the measured signals under the case of electrode loss. The sampling frequency is 250Hz and the total length is 2394.58s, in which there are the six segments of artifacts and the eleven segments of ECGs, in total 167.60s and 2226.98s respectively.

Algorithm

For a given ECG segment with the length of *L*s, the three steps are carried out to identify its type using the novel algorithm.

Step1: Calculating the standard deviations of R-R interval (RRI) and R-peak amplitude in this ECG segment. If both parameters are synchronously greater than the two given thresholds (denoted by *ThrRR* and *ThrRA*), the segment is judged as ECG artifact beats. Otherwise, go to the next step.

Step 2: The ECG segment between 0.3*RRI at each R-peak before and 0.6*RRI at the R-peak after is selected as a template. If the length of a template is less than 100ms, the template is replaced by ECG segment of 700ms starting from 0.3*RRI at this R-peak before. The aim is to ensure each template contains at least three heartbeat cycles for detecting the rhythm.

Step 3: The shift correlation is calculated between the given ECG segment and the template and the correlation function r(i), $i=1,2,3,\cdots, L$ is obtained. The periodic wave peaks in the r(i) can be used to reveal the rhythm of the ECG segment. Since the probability that three continuous

wave peaks appears in r(i) for the ECG artifacts is very small, the amplitude of the third wave peak of r(i) is selected as the feature parameter discriminating the rhythm of the ECG segment. If this parameter is less than the given threshold (denoted by *Thrmax*), the ECG segment is identified as artifacts.

Results

When the *ThrRR*, *ThrRA* and *Thrmax* are set as 20, 10 and 0.75 respectively, the performance of the algorithm reaches optimal on the training data. The accuracy, sensitivity and positive prediction value of the algorithm on the independent data are 97.16%,92.24%,73.76% respectively, which are better than other related methods on the same data.

Conclusions

The logical structure and the computational complexity of the algorithm are simple and low respectively. The algorithm is sensitive to the artifact beats since of high sensitivity. Thus, it is suitable to be applied in the identification of artifact beats in long ECG recordings.

SP007.7 - Automatic Detection of Low-Quality Seismocardiogram Cycles Using the Outlier Approach

Author(s): <u>Vahid Zakeri</u>¹, Farzad Khosrow-Khavar², Kouhyar Tavakolian³

¹Heart Force Medical Inc., Vancouver/BC/CANADA, ²Engineering Science, Simon Fraser University, Burnaby/BC/CANADA, ³Electrical Engineering, University of North Dakota, Grand Forks/ND/UNITED STATES OF AMERICA

In this study, an algorithm was developed to automatically detect the low-quality (LQ) cardiac cycles in seismocardio-gram (SCG). The proposed algorithm extracts some features from the SCG signal, which are referred to as signal quality indices (SQIs), and computes the outlier points of each SQI. Our hypothesis was that the identified cycles (outliers) would include the LQ ones. To verify this hypothesis, the algorithm results were compared with the LQ cycles that were labeled manually by an expert in the field. The developed algorithm was tested on total 1697 cardiac cycles, and there was a great overlap between the computed outliers and the LQ cycles (84% of 248 LQ cycles were identified). The proposed algorithm is simple, efficient, and works in an unsupervised manner.

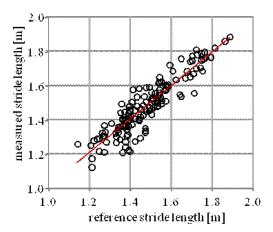

SP008 - Spinal Cord and Brain Injury Treatment

TRACK 10: REHABILITATION MEDICINE, SPORTS MEDICINE, REHABILITATION ENGINEERING AND PROSTHETICS

SP008.1 - A Validation Test of a Simple Method of Stride Length Measurement Only with Inertial Sensors and a Preliminary Test in FES-assisted Hemiplegic Gait

Author(s): <u>Takashi Watanabe</u>¹, Tasuku Miyazawa² ¹Graduate School Of Biomedical Engineering, Tohoku University, Sendai/JAPAN, ²Graduate School of Engineering, Tohoku University, Sendai/JAPAN

This study aimed to realize simplified gait evaluation system only using inertial sensors in order to support motor rehabilitation, healthcare and so on. In this paper, stride length measurement only with inertial sensors for the simple gait evaluation system was tested. First, a calculation method of the stride length was developed, in which acceleration and angular velocity signals of the foot were used. In order to calculate the stride length, the beginning and the ending of the foot movement during walking were detected by acceleration signal for determination of the integration period of motion acceleration of the foot. The motion acceleration was calculated from acceleration and angular velocity signals. The measurement method was evaluated in 10 m walking of 6 neurologically intact subjects attaching inertial sensors using stretchable band on their feet (shoes). Reference data for the stride were measured with portable walkways with embedded, pressure-sensitive sensors. The average values of error and absolute error of measured stride lengths were 0.38±4.77% and 3.36±3.04%, respectively. Correlation coefficient of the measured length with the reference data was 0.910 and the slope of the regression equation was 0.978. Then, stride lengths of a hemiplegic subject were measured in 10 m walking with and without FES-assisted foot drop correction. Although there was no difference in stride length between with and without the FESassist, the calculated data from inertial sensor signals supported that the time for 10 m walking measured by therapists decreased when the subject walked with the FES-assist. It was expected that the stride length measurement only with inertial sensor would be practical, and it can be implemented easily.

SP008.2 - A novel Treadmill Body Weight Support system using Pneumatic Artificial Muscle actuators: a comparison between active Body Weight Support system and counter weight system Author(s): <u>Thuc V. Tran</u>¹, Flavio Prattico², Shin-Ichiroh Yamamoto³ ¹Bioscience Engineering, Shibaura Institute of Technology, Saitamashi/JAPAN, ²Department Of Industrial And Information Engineering And Economics, Università degli Studi dell'Aquila, L'Aquila/ITA-LY, ³Department Of Bioscience And Engineeering, Shibaura Institute of Technology, Saitama City/JAPAN

In recent years, Treadmill Body Weight Support System has been developed and proved the improvement for patients who recover from Spinal Cord Injury. Passive and dynamic systems were shown their capacities to maintain unloading force in the vertical direction, however, there are no system considered that track the moving of the Center of Pressure trajectory during gait training. Our hypothesis is that tracking Center of Pressure trajectory, during gait training, could be more effective than the common system. This paper proposed a new active Body Weight Support system using Pneumatic Artificial Muscle actuators. An active model of new Body Weight Support system with the tracking model of the human center of pressure was developed. The validation tests experiments were implemented with three levels of unloading force 30%, 50% and 70% using new Body Weight Support system and counter weight system for comparison. The speed of the treadmill is set, for all the experiments at 2 km/h. Center of pressure trajectories are recorded for a normal random walk, for the counter weight system and for the Body Weight Support systems. The results showed that the center of pressure trajectory using active system was much fitter with center of pressure pattern of normal gait than counter weight system.

SP008.3 - A Serious Game for Training and Evaluating the Balance of Hemiparetic Stroke Patients

Author(s): <u>Pedro Bertemes-Filho</u>¹, Fabricio Noveletto¹, Antonio V. Soares², Marcelo D.S. Hounsell³

¹Electrical Engineering, Universidade do Estado de Santa Catarina, Joinville/BRAZIL, ²Faculdade Guilherme Guimbala, Associação Catarinense de Ensino, Joinville/BRAZIL, ³Science Computing, Universidade do Estado de Santa Catarina, Joinville/BRAZIL

Stroke is the major cause of disabilities in adults and the second major cause of deaths worldwide. People that survive a stroke present deficits that affect their functional capacities and require rehabilitation for long periods. The use of digital entertaining games has shown to be a helping ally to the rehabilitation process, despite its therapeutic limitations. An alternative to these limitations is the development of games and control interfaces targeted the needs of patients, the so called Serious Games. The aim of this paper is to present the development of a Serious Game for training and evaluation of balance in hemiparetic stroke patients. An integrated biomedical system was, which consists of a balance board with inertial sensors instrumentation and a computer system that runs the game. The aim of the game, called myBalance, is to direct a ball to a target position according to the board signals. Various parameters of the game can be adjusted to comply with patients' limitations. The game has a scoring system that extracts metric information regarding patients' performance during gaming. Preliminary results indicate that the system (board and game) can be easily used for training and evaluation of patients' balance. It was also showed that the game can be used as a metric system for clinical studies. Future works include comparing game scores to standard clinical scales for balance.

SP008.4 - fNIRS-based analysis of brain activation with knee extension induced by functional electrical stimulation Author(s): Misato Ohdaira¹, Tomoko Kamisawa², Soichiro Morishita³, Yinlai Jiang³, Osamu Yamamura⁴, Hiroshi Yokoi³ ¹Mechanical Engineering And Intelligent Systems, yokoi Laboratory, The University Electro-Communications, Chofugaoka, Chofu, Tokyo/JAPAN, ²Fukui-Ken Saiseikai Hospital, Fukui/JAPAN, ³The Brain Science Inspired Life Support Research Center, The University Electro-Communications, Chofugaoka, Chofu, Tokyo/JAPAN, ⁴Second Department of Internal Medicine University of Fukui, Fukui/ JAPAN

Patients suffering from paralysis due to aging, accidents, or brain injuries are increasing worldwide. Consequently, there is a compelling need for effective methods for the recovery of motor functions. The involvement of brain plasticity has been suggested effective and previous studies have reported that lost motor function and efficiency due to brain damage can be regained by repeatedly increasing and decreasing brain activation. Functional electrical stimulation (FES) has shown its effectiveness in the recovery of motor function. Brain activity usually decreases with the improvement of muscle control by FES. This study investigated the generality of brain responses during rehabilitation with FES in order to elucidate the recovery mechanism. We monitored the brain activity of one healthy subject with fNIRS over a ten-day period (one experiment per day) during which the knee joint movement was induced by FES with different parameters. The subject was seated in the chair of a leg extension device (Fig.1). The measurement regions covered the primary motor cortex and the somatosensory cortex with transmitters and receivers shown in the right of Fig. 1. Receiver No. 5 in Fig. 1 was positioned on the Cz of the international 10-20 system. We stimulated his left quadriceps muscle with the FES device for 4 seconds. The results suggest that the observed increases and decreases of brain activity induced by FES are common (Fig.2). It is suggested that increasing and decreasing brain activation was evoked by long-term FES stimulation. Further research is needed to examine greater numbers of healthy subjects and patients suffering from paralysis to determine the optimum stimulation parameters for brain activation to involve brain plasticity.

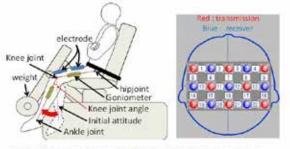

Figure 1. Leg extension experiment and measurement area.

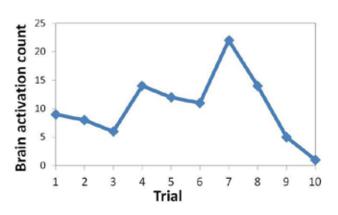

Figure 2. Temporal changes of brain activation counts.

SP008.5 - Muscle fatigability of isometric and isokinetic kneeextension generated by single-electrode- and spatiallydistributed-sequential-stimulation.

Author(s): <u>Austin J. Bergquist</u>¹, Vishvek Babbar², Milos R. Popovic², Kei Masani²

¹Toronto Rehabilitation Institute, University Health Network, Toronto/ CANADA, ²Institute Of Biomaterials And Biomedical Engineering, University of Toronto, Toronto/CANADA

Background:

Functional electrical stimulation is used in rehabilitation to generate muscle contractions and is conventionally applied using a single active electrode (Single-Electrode-Stimulation; SES; Figure 1A). During SES, muscle fibres are activated in synchrony with each stimulation pulse, resulting in the need of unnaturally high stimulation frequencies to generate functional contractions. High stimulation frequencies result in rapid fatigue, negatively impacting benefits of stimulation rehabilitation. To address this issue, researchers have "spatially distributed" and "sequentially" interleaved stimulation pulses between multiple active electrodes (Spatially-Distributed-Sequential-Stimulation; SDSS; Figure 1A). SDSS allows muscle fibres to be activated in an asynchronous manner, reducing the stimulation frequency at each active electrode, while maintaining activation of the muscle as a whole (Figure 1B). Although SDSS can improve fatigue-resistance of isometric contractions, this method has not been tested during non-isometric conditions.

Purpose:

To reproduce previous findings that SDSS can improve fatigue-resistance of isometric contractions, and to extend this line of inquiry to isokinetic conditions.

Methods:

Two healthy volunteers participated in a 4-hr experiment. Stimulation (40 Hz; 0.3-s-on:0.7-s-off; 120-s total) was delivered to the knee-extensors using SES and SDSS, in separate trials, to generate isometric (0°/s) and isokinetic (180°/s) torque. Isometric and isokinetic contractions were tested on separate legs in separate trials. A rest period of 2-hr was provided between repeated testing of each leg. Protocol order was randomized. Stimulation intensity was set to generate ~40% maximum-voluntary-contraction.

Results:

Fatigue indices were calculated (final torque/initial torque) for isometric (SES=0.37; SDSS=0.57; Figure 1C) and isokinetic (SES=0.36; SDSS=0.39; Figure 1D) contractions.

Conclusion:

Previous findings that SDSS can improve fatigue-resistance of isometric contractions were reproduced. However, the effect of SDSS on improving fatigue-resistance may not be as pronounced during isokinetic, compared with isometric, contractions.

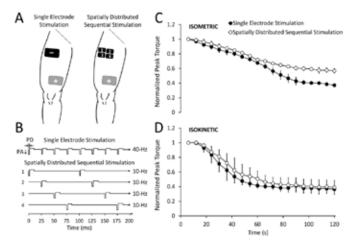

Figure 1. A) Schematic representation of single-electrode- and spatially-distributed-sequential-stimulation (SES and SDSS, respectively). B) Stimulation pulse shape and timing (PD=Pulse Duration; PA=Pulse Amplitude). During SES, pulses were delivered to a single active electrode at 40-Hz. During SDSS, each active electrode (1, 2, 3, 4) was stimulated at 10-Hz, resulting in a 40-Hz stimulation frequency delivered to the knee-extensors as a whole. Normalized isometric (C) and isokinetic (D) peak torque recorded during SES and SDSS (n=2). For each volunteer, peak torque was averaged over 6 contractions to generate 20 data bins. These data were pooled to calculate group means for each bin. Symbols represent group means at each bin. Error bars represent 1 standard deviation.

SP008.6 - External modulation of electrical stimulated spinal reflexes - a control modality for human lumbosacral networks in injury induced disconnection from brain control Author(s): <u>Winfried Mayr</u>¹, Matthias Krenn¹, Milan R. Dimitrijevic² ¹Center Of Medical Physics And Biomedical Engineering, Medical University of Vienna, Vienna/AUSTRIA, ²Foundation for Movement Recovery, Oslo/NORWAY

Spinal Cord Injury (SCI) can result in various profiles of functional losses in both conducting and processing neural structure in the lesion zone. Sub-lesion structures remain intact, but lose control inputs either directly, due to interrupted efferent pathways or indirectly, by missing reactions due to interrupted afferent pathways, or disturbed processing in damaged higher spinal networks. Identification of artificial control options for this locally altered physiology is an important goal towards improvements in the restoration of movement strategies. Unmasking of functional processes in the present interneuron networks is essential and can be investigated by application of electrical stimulation to afferent nerve structures at lumbar spinal level and recording of reflex reactions from lower extremity muscles. Stimuli can be administered via implanted epidural electrodes or non-invasively via skin attached electrodes. Reactions in the networks reach from monosynaptic, via polysynaptic to complex interneuron processing pathways. Stimulation inputs can induce augmentation and suppression effects resulting in complex motor output patterns that can lead to tonic, rhythmic and even antagonistically coordinated muscle activity. In the current work we show examples how this spectrum of controllable motor outputs can depend on the stimulation parameters frequency and intensity and how the parameter dependent modifications of recorded reflex reactions can support conclusions on underlying neuronal mechanisms, in intact and in altered network structures. Technically this can lead to identification of control characteristics for development of effective support tools, for rehabilitation medicine. We can expect novel treatment options for restoration of movement and a higher potential for regaining functions for persons with SCI.

SP008.7 - Motor Control Assessment using Leap Motion: Filtering Methods and Performance in Indoor and Outdoor Environments Author(s): Jone J. Kim¹, Dave A. Gonzalez², Adam Mintz², Eric A. Roy², James Y. Tung¹

¹Mechanical And Mechatronics Engineering, University of Waterloo, Waterloo/CANADA, ²Kinesiology, University of Waterloo, Waterloo/ CANADA

In this paper, we describe and evaluate a filtering method designed to remove the artifacts from hand/finger kinematics acquired using the Leap Motion controller (or 'Leap'). We report two experiments evaluating this methods': 1) accuracy and precision compared to an established motion-tracking system (Optotrak) and 2) performance in indoor and outdoor environmental conditions. The main findings were that the filtered Leap finger output: i) compared well to motion capture systems in temporal accuracy and precision, ii) moderately well in spatial accuracy and precision, and iii) adequately in indoor settings, but not in outdoor conditions. These advances will inform further development of new tools to assess human motor control

SP008.8 - Biceps brachii EMG signals: estimation of dipole sources

Author(s): <u>Peyman Aghajamaliaval</u>¹, Pierre A. Mathieu², Mickael Corinthios¹, Michel Bertrand², Jean Laurier²

¹Génie électrique, École Polytechnique, Montréal/CANADA, ²Physiologie Moléculaire Et Intégrative, Institut de génie biomédical, Montréal;/QC/CANADA

The biceps brachii (BB) was shown to be anatomically composed of up to 6 innervated compartments from which as many independent electromyographic (EMG) signal sources could be obtained. Extracting several signals from a single muscle would allow upperlimb amputees to produce several forearm/hand movements with a myoelectric prosthesis. While normal subjects were either sitting or standing-up, we investigated how to activate those compartments by using various right upper limb and hand positions. Five pairs of surface electrodes were put across the short head (SH) and 5 others pairs over the long head (LH) of the BB. Five seconds EMG signals were recorded during isometric contractions produced at a constant level. RMS value of each signal was obtained.

EMG signals where assumed to originate from dipole sources within the arm. A peel-off method served to search for up to 6 dipoles which were used as moving sources in a 3-D finite element forward model study (COMSOL). Arm was modeled either as a single or as 4 concentric cylinders (for skin, subcutaneous fat, muscle and humerus). Comparison was made between amplitude of the simulated and experimental signals.

Results for one seated subject are shown in Fig. 1. In column A, there are significant amplitude differences between some of the experimental signals and model predicted values. Differences were reduced in a second iteration during which dipole parameters are readjusted (column B). With a 4 layers model (column C), differences can be larger and it is also observed that some dipole positions are physiologically incorrect (i.e. in the fat layer). So, while the peel-off method provides a first estimate of the dipoles characteristics, the 4 layers model is necessary to do the proper dipoles readjustments that constrain the position of the dipoles to the muscular tissue.

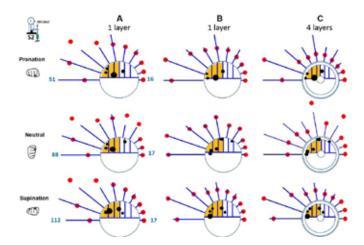

Fig.1. The subject upper-arm is modelled as a single and 4 cylinders geometry within which the 6 compartments of the biceps are hypothetically represented as equal trapezoidal areas (short head region is shaded). The 10 radial line lengths are proportional to the experimental signals RMS values (μ V). Position of the outer red bullets is proportional to the simulated results. Within the arm, the amplitude of the dipoles, shown as black bullets, is proportional to their relative intensity. A) Four to five dipoles were obtained with the peel-off method. B) Results obtained following adjustment of those dipoles. C) Same dipole as in B), but using the 4 cylinders model.

SP008.9 - Validating a Solid-Static Single-Armed Male Prototype Tasked to Produce Dynamic Movement from the Shoulder Through the Preparation Phase

Author(s): <u>Alicia M. Gal</u>¹, Adrian D.C. Chan¹, Dean C. Hay² ¹Computer System Engineering, Ottawa Carleton Institute for Biomedical Engineering, Ottawa/CANADA, ²Physical And Health Education, Nipissing University, North Bay/CANADA

The purpose of this study was to design, implement, and validate a methodology to determine baseline measures during the preparation phase (PREP) of seated weight-bearing locomotion. In order to evaluate this methodology this study investigated the external movement produced by the shoulder joint-centre of the upper limb through a seated downward poling motion. A solid-static anatomically correct prototype was designed to produce isolated dynamic movement about a human's shoulder joint-centre; this particular investigation replicated the average male weighing 80kg having fixed elbow (135°) and wrist-stick (45°) angles, and dynamic shoulder start angles (-10°, 0° and +10° to the horizon). The prototype was tasked to produce PREP; a phase identified in seated locomotion produced through a double poling fashion. Trajectory and reaction forces created through PREP were evaluated using a standard Newton-Euler mathematical model in conjunction with a 3-dimensional motion capture system and force plate. Trajectory data concluded that the prototype was of reliable and valid mechanical design producing near identical curves for all trials individually as well as combined averages. Evidence also indicated that all trials displayed similar reaction forces, which produced torque in an anticlockwise direction about the shoulder. Since the prototype is solid and designed to mimic the male upper limb data can be used to describe minimal reaction forces onto the shoulder joint produced from PREP. Understanding external forces at baseline measures allows for valid assumptions to be made or dismissed concerning internal forces within the human body. Dynamic biomechanical analysis requires assumptions involving internal and external parameters when producing a movement. The addition of PREP to the seated propulsion cycle is unclear identifying the need to investigate the biomechanics produced through this phase; full arm extension to pick-plant. This study has developed an improved model of the upper limb during seated double poling.

SP009 - Patient Safety, Medical Errors and Adverse Events Prevention Related to Health Technologies and Incident Analysis and Management

TRACK 16: CLINICAL ENGINEERING, CLINICAL PHYSICS, AND PATIENT SAFETY

SP009.1 - Technological Surveillance and Integrity Monitoring of Infusion Systems

Author(s): <u>David Grosse-Wentrup</u>, Uvo M. Hoelscher Center For Biomedical Engineering And Ergonomics, Münster University of Applied Sciences, Steinfurt/GERMANY

Infusion therapy is a routine medical procedure. As errors can have potentially fatal consequences, monitoring of infusion systems is mandatory. At present, the technical monitoring of infusions is limited to only a few properties of the infusion system. This passes the demand for vigilance on to the clinical personnel and potentially leaves errors undetected.

By sending small pressure pulses through the interconnected infusion lines, a route map of the infusion system can be created. This map visualizes the connections of infusion lines including line lengths, connection points and connected infusion devices.

This way, errors in the infusion system setup, loosened connections, erroneous stopcock positions and thereby caused under-infusion or reflux can be automatically detected, indicated to clinical personnel, and subsequently corrected before causing harm to the patient.

SP009.2 - Evaluating Patient Safety Risks Related to Oral Chemotherapy: Evolution of a Human Factors Informed Failure Mode and Effects Analysis Framework

Author(s): <u>Melissa Griffin</u>¹, Rachel Gilbert¹, Larry Broadfield², Andrea Cassano-Piche¹, Anthony Easty³, Patricia Trbovich¹ ¹Centre For Global Ehealth Innovation, University Health Network, Toronto/ON/CANADA, ²Cancer Care Nova Scotia, Halifax/CANA-DA, ³Ibbme, University of Toronto, Toronto/CANADA

Chemotherapy is commonly used to treat cancer, which is the leading cause of death in Canada (PHAC, 2012). Chemotherapy treatment involves the use of complicated and flexible drug protocols to care for patients experiencing different types and stages of cancer. A variety of healthcare professionals, who practice in different locations, are involved in the delivery of chemotherapy. Traditionally, most intravenous (IV) chemotherapy is administered to patients in hospital settings, but more recently oral chemotherapy is being delivered in the home and community. Many patients, families, and providers prefer oral to IV chemotherapy for several reasons, including its perceived convenience (Liu, 1997). Manufacturers are facilitating this shift, with an estimated 25% of the 400 new medications currently in development being formulated as oral medications (NCCN, 2008).

IV and oral chemotherapy have comparable toxicity risks and the potential to cause serious harm when not managed properly. However, oral chemotherapy is associated with some unique challenges, such as access, adherence, and safe handling. Many of these challenges stem from a shift in responsibility for administering chemotherapy from healthcare professionals to patients and their families. With increased attention being paid to oral chemotherapy safety (Neuss, 2013), a Canadian provincial cancer agency approached HumanEra, a team comprised of human factors specialists, to analyze their current practices and identify any risks and opportunities related to oral chemotherapy from a human factors perspective.

Two human factors specialists collected field data using direct observations and semi-structured interviews. Healthcare professionals involved in providing patients with chemotherapy, such as staff in the cancer centre clinics and pharmacy, as well as a number of community pharmacies, were included during data collection. Process maps were created to describe chemotherapy-related processes from when lab work was done through to when chemotherapy was dispensed in the community.

Data were analyzed using a human factors informed failure mode and effects analysis (HFFMEA) framework. This framework was developed iteratively, and is also presented in the upcoming Human Factors for Health Technology Safety book (Cassano-Piché, et al, in preparation). Unlike more traditional FMEA frameworks, the HFFMEA framework guiding this assessment included three tests: the severity test, the hazard score test, and the single point weakness test; to prioritize which key failure modes to focus on for the remainder of the analysis, making the analysis more efficient. Using this framework, a total of 201 failure modes were identified, with 73% of those being key failure modes requiring further analysis. Although 147 failure modes were still prioritized as key failure modes requiring further attention and analysis (e.g., patient removes the incorrect number of pills from their bottle), the HFFMEA framework allowed 54 failure modes to be set aside before time was invested identifying causes and recommendations for these lower priority risks (e.g., pharmacy assistant does not pick chemotherapy drug from shelf).

This presentation will provide an overview of the HFMEA framework and highlight results from applying this framework to oral chemotherapy processes in a Canadian province, to demonstrate how HFMEA can be used to improve healthcare safety.

SP009.3 - Alarm Management Study in Pediatric Special Care Unit

Author(s): <u>Christopher J. Bzovey</u>¹, Paul Prowse² ¹Clinical Engineering, Winnipeg Regional Health Authority, Winnipeg/MB/CANADA, ²Clinical Engineering, Winnipeg Regional Health Authority, Winnipeg/CANADA

There have been a number of critical incidents reported where improperly managed alarms contribute to alarm fatigue in clinicians resulting in patient harm or mortality. Numerous studies have been published in the United States; however there appears to be a lack of publications on alarm management investigation studies conducted within Canada.

The purpose of this work was to investigate the current state of alarm communication and management within the Pediatric Special Care Unit (PSCU). The investigation included an environmental assessment, a staff survey, and a review of the alarm event logs from several medical devices. The staff survey investigated current alarm management practices by analyzing self-reported effects of alarm fatigue experienced in the PSCU. The survey identified ventilators and patient monitors as most heavily contributing to alarm load. Alarm logs were collected from those devices.

The environmental assessment revealed that ventilators within the unit are connected to a latching nurse call system, which requires staff intervention to reset. Within 30-40 seconds after alarming, the alarm increases in volume and pitch resulting in greater distress for the staff and patients within the unit. The staff survey identified that the alarm load they experience has a moderate to high effect on their ability to provide safe patient care (Figure 1). Data collected from the patient monitors demonstrated a significant difference between the number of alarms during the day and night shifts (Figure 2).

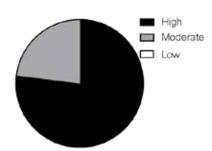

Figure 1: Staff response to the effects of alarm loading experienced in PSCU.

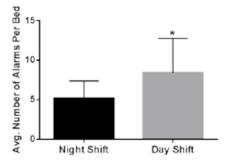

Figure 2: Average number of patient monitor alarms in PSCU per bed during the 12 hour night and day shifts. (*significant difference, p < 0.05)

This work demonstrates that alarm load is a problem in the PSCU, and furthermore the intensity is dependent on the time of day. A committee has been established to discuss potential solutions for mitigating the alarm load. The success of this will be discussed during the presentation.

SP009.4 - Failure Modes and Effect Analysis for Stereotactic Radiosurgery: a comparison among three radiotherapy centers in Brazil.

Author(s): <u>Flavia Cristina S. Teixeira</u>, Carlos E. Dealmeida, Mohammed S. Huq

Lcr, LCR/UERJ, Rio de Janeiro/BRAZIL

Task Group 100 of the American Association of Physicists in Medicine recommended the adoption of prospective quality management techniques such as process mapping, failure modes and effects analysis (FMEA) and fault tree analysis (FTA) for analyzing clinical processes and for designing clinic- and site-specific quality management programs that are based on risk assessment. According to this approach, each facility determines the hazards and risks at their own facility based on their own processes and procedures. Appropriate quality control measures are then put in place to mitigate the risks associated with a given process. The goal of the present work was to evaluate the process maps for stereotactic radiosurgery (SRS) treatment at three radiotherapy centers in Brazil and apply the FMEA technique to evaluate similarities and differences, if any, of the hazards and risks associated with these processes. A team, consisting of professionals from different disciplines and involved in the SRS treatment, was formed at each center. Each team was responsible for the development of the process map, and performance of FMEA and FTA. A facilitator knowledgeable in these techniques led the work at each center. The TG100 recommended scales were used for the evaluation of hazard

and severity for each step. Results of the application of FMEA for the major process "treatment planning" are reported here. Hazard index given by the Risk Priority Number (RPN) is found to range from 4 - 270 for various processes and the severity (S) index is found to range from 1 - 10. The RPN values > 100 and severity value \ge 7 were chosen to flag safety improvement interventions. Number of steps with RPN >100 were found to be 6, 45 and 59 for the three centers. The corresponding values for S \ge 7 are 24, 21 and 25 respectively. The range of RPN and S values for each center belong to different process steps and failure modes (see table).

Radiotherapy	Process Step	Potential	Potential	S	RPN
Center		Failure Mode	Causes of Failure	Min- max	Min- max
Center I	Evaluate DVH	Minimum Dose At Target Not Evaluated	Lack of Standard Procedures	1-10	4-162
Center II	Proceed the Image Fusion	Imaging Not Fused Properly	Software Failures	1-10	7-270
Center III	Insert the Total Dose on TPS	Wrong Dose Inserted	Incorrect Prescription	1-10	4-245

These results show that interventions to improve safety is different for each center and it is associated with the skill level of the professional team as well as the technology used to provide radiosurgery treatment. The present study will very likely be a model for implementation of risk-based prospective quality management program for SRS treatment in Brazil where currently there are 28 radiotherapy centers performing SRS. A complete FMEA for SRS for these three radiotherapy centers is currently under development.

SP010 - Education and Training in Biomedical Engineering

TRACK 17: EDUCATIONAL AND PROFESSIONAL ACTIVITIES

SP010.1 - Biomedical Engineering in Nigeria: A Developmental Overview

Author(s): <u>Kenneth I. Nkuma-Udah</u>, Gideon I. Ndubuka, Kennedy O. Ejeta

Department Of Biomedical Technology, Federal University of Technology, Owerri, Nigeria, Owerri/NIGERIA

Biomedical Engineering (BME) activities in Nigeria can be said to have started in the 1970s during which collaborative efforts were made by engineers, medical doctors, pharmacists, physicists, technicians and other scientist. Although, the pace of development was hitherto slow, most efforts were in the area of training - short courses, continuing education or professional development. However, the coming of NIBE in 1999 has propelled a steady progress of BME activities in Nigeria. This is rightly so, because Nigerian BME professionals from 1999 started addressing issues concerning them as a professional group. BME activities in Nigeria was further given a big boost in 2007, when the first undergraduate programme in BME started in the Federal University of Technology, Owerri, Nigeria with NIBE contributing the foundation members of faculty. NIBE, which stands for Nigerian Institute for Biomedical Engineering, represents the BME profession and its members in Nigeria and in international organisations. Established in 1999 with the vision "to develop and advance the biomedical science, health and human well-being of Nigeria through modern technological approaches comparable to those obtainable in any developed country of the world", NIBE has members largely of the various sciences and classical engineering disciplines from universities and hospitals as well as from other institutions/organisations. It has a membership list of over 2000 members, but financially active membership fluctuates between 100 and 200 depending on the BME activity of each year. NIBE is currently structured in 5 divisions - biological engineering; medical engineering; clinical engineering; rehabilitation engineering; and biomedical physics / allied sciences - to accommodate virtually every field in the sciences. It had its 1st annual BME conference in 2000. Since then it has organised 9 national biomedical engineering conferences and 6 national professional development courses in Nigeria. NIBE has published a newsletter, news@nibe since 2000; a professional journal, Nigerian Journal of Biomedical Engineering since 2001; and electronic mail news, e-nibe since 2003. In 2003, NIBE was admitted as the 50th member of IFMBE. The same year, she co-founded the African Union of Biomedical Engineering and Sciences (AUBES) in Ghana while some members were on a Medical Equipment Training. AUBES was established in order to integrate the effort of various African BME professionals and to expand cooperation on a continental basis. Since 2003, NIBE has made effort with AUBES to pioneer the development of BME in Africa. AUBES's official inauguration and the 1st African Biomedical Conference scheduled to hold in 2005 in Nigeria was cancelled for logistic reasons. However, sustained effort is being geared towards its official inauguration in 2016 in Nigeria. The role of NIBE in developing BME in Nigeria is mainly as a membership group to develop resources for BME by evolving adequate training programmes for members, facilitating accreditation and certification of professionals practicing BME in Nigeria. NIBE is expected to continue to give its members a sense of belonging by becoming the mouth piece of BME professionals in Nigeria. All these development efforts should be a matter of concern for the international BME community.

SP010.2 - Biomedical Engineering Education in Peru in 2015: A Unique and Innovative Collaboration in Latin America Author(s): <u>Rossana Rivas</u>¹, Luis Vilcahuaman¹, Michael Cieza², J.Tobey Clark³, Herbert F. Voigt⁴

¹Bioengineering Laboratory, Bme Ms Program, Pontifical Catholic University of Peru, Lima/PERU, ²School Of Medicine, Universidad Peruana Cayetano Heredia, Lima/PERU, ³Biomedical Physics & Technology, Instrumentation & Technical Services, University of Vermont, Burlington/VT/UNITED STATES OF AMERICA, ⁴Biomedical Engineering, Boston University, Boston/MA/UNITED STATES OF AMERICA

The Peruvian health sector has a major shortcoming in Latin America because it does not have enough biomedical engineers (BMEs). This situation leads to negative impacts on the quality of a number of outcomes, including: health services, research, management, policies, regulation, etc. Health technology today is engaged in all the key processes: planning, operational, financial, that supports the health organizations. Despite Peruvian health professionals' efforts the lack of an appropriate technological environment and sufficient numbers of BME professionals prevents a good understanding and/or management of the situation, thus affecting the decisions applied to key aspects involved in the sustainability, effectiveness and health disparities in the Peruvian health organizations, both public and private. In addition, the costs due to these inefficiencies jeopardize the governmental investment (public health sector) and the gains of the health enterprises, leading to ineffective, unsafe and inequitable patient care. BME is a discipline devoted to the use of engineering principles and techniques to the study of biological, physiological and medical processes at all length scales. It is a fast growing career in both developed and developing countries, and contributes to the scientific, economic and social development and welfare of society. Its roots are firmly embedded in applying the engineering perspective to health delivery systems and health technology management (clinical engineering). It has been exceptionally successful in applying computational modeling techniques to describe complex biological systems and providing context for experimental approaches to molecular, cellular, tissue and organ system processes. Recently, understanding of biological phenomena has been informing the design of new engineering materials and processes (biomimetic). Most Latin American countries have this specialization at the undergraduate level; model programs exist in Argentina, Brazil, Colombia and Mexico. Two leading Latin American private Peruvian universities, Pontificia Universidad Católica del Peru (PUCP) and Universidad Peruana Cayetano Heredia (UPCH) have agreed to create a joint world-class BME undergraduate program using the institutions' strengths. Peruvian BME status is rising quickly. This academic project between PUCP-UPCH to develop the BME curriculum is a valuable and exciting collaboration. We report here the current situation in Peru with respect to the rise of BME

SP010.3 - Improving Biomedical Engineering in Uganda through education, benchmarking and mentorship Author(s): Robert T. Ssekitoleko

Physiology, Makerere Univesity, Kamapla/UGANDA

Introduction

The field of biomedical engineering is just emerging in many low resource settings. In Uganda, the majority of people looking after and repairing medical equipment have not got appropriate training and skills. In most cases electricians are employed to work mainly as handy men fixing the majority of electrical problems as well as medical devices across the health facilities. Some of these technicians do get some short courses to train them in looking after some specific models of medical equipment. The country has recently accepted that biomedical technicians and engineers are needed for the appropriate management of medical equipment. In some cases, the biomedical engineers are recruited from abroad to either consult or work as permanent employees. Three training centres in the country have started biomedical engineering training. ECUREI started a biomedical technician diploma before the Ministry of Health initiated a diploma training with Kyambogo University 3.5 years ago. This diploma is supported by the Amalthea trust from the UK. Makerere University started a degree programme 3.5 years ago. With all this training happening, the technicians and engineers job roles have not yet been included in a lot of government hospitals with pay scales a big challenge to many aspiring technicians and engineers in the field.

Methods

A sustainable volunteering project was developed to improve skills of technicians working in seven hospitals. None of the technicians chosen for the project had any formal training in medical equipment management but were routinely involved with the repairs. The main objectives were to improve the process of procurement, repair and disposal of medical equipment by benchmarking with UK and other international standards. A volunteer Biomedical Engineer was recruited from the UK to work as a trainer and provide in-house mentorship to the technician for over 2 years.

The project was in collaboration with the Amalthea trust who provided intensive two weeks training in each year through Kyambogo University. Different parties, including the Ministry of Health, Commercial medical equipment providers and the professional association were always involved throughout the duration of the project. The volunteer also contributed to lecturing and improving the degree programme at Makerere University. Collaboration was formed with the Uganda Industrial Research Institute to replicate the work in other hospitals.

Four technicians were taken to the UK through the commonwealth professional fellowship programme to gain more on job experience.

Results

The technicians showed improved skills, knowledge and confidence about medical equipment management. There has been increased awareness of biomedical engineering profession through workshops and conferences. Inventories were developed using Microsoft Excel and they have been updated yearly since the beginning of the project. There has been increased confidence in the technicians by the clinicians about them handling the medical equipment. The link for the biomedical engineering volunteer between the hospitals and Makerere University means that the students have easy access and can always get feedback from real life scenarios. Some hospitals have set up biomedical engineering workshops and recruited biomedical technicians as a direct result of the project.

SP010.4 - Designing Biomedical Engineering Programs to Prepare for Medtech Industry

Author(s): <u>Shankar Krishnan</u> Biomedical Engineering, WIT, Boston/MA/UNITED STATES OF AMERICA

The astounding arrays of inventions, innovations and implementations of technologies have resulted in a huge growth in the medical devices and systems worldwide. Medtech industry is instrumental in manufacturing complex medical devices and systems. A vital role is played by Biomedical engineering (BME) in research and development by creating advances in applications of multidisciplinary technologies which ultimately traverse towards improved and efficient health care delivery, which generates consistently increasing demands for biomedical engineers at the international levels. Consequently, the needs for biomedical engineers trigger corresponding requirements for training biomedical engineers, especially for the medtech industry. The responsibility of developing academic programs to train students to gain multidisciplinary knowledge and adequate expertise in research, design, development, manufacturing, operations, compliance and regulatory affairs is bestowed on the academic leaders who face numerous challenges. The objective of this paper is to determine the challenges and present potential solutions in the design of undergraduate biomedical engineering programs to prepare the students for meeting the existing and emerging demands of medtech industry.

The duration of a typical undergraduate BME program is four years in most American Universities. Major challenges are encountered while designing a comprehensive undergraduate BME curriculum within the available duration. Essential factors including the breadth and depth of BME coverage, distribution of relevant theoretical and practical aspects, and, course work, laboratory work, project work knowledge and skillset to fulfill the graduation requirements, in conjunction with appropriate preparation for career paths, are to be considered diligently in the overall design of the BME program. Foundations in mathematics, sciences and engineering are vital prerequisites to the core courses in BME. For achieving superior student outcomes pertaining to conducting experiments and carrying out projects, well-equipped laboratories and faculty mentors with related academic and industrial experience are essential. Additionally, a cluster of elective BME courses catering to the existing and emerging needs of the industry and employers must be incorporated in the curriculum. The aforementioned factors pose strenuous challenges in the BME program design.

A few model designs of BME programs are developed to overcome the challenges cited above. The curricula for the proposed models are formulated employing general structure, track-based structure, and emphasis-based structure. A preferred model is based on emphasis of medical devices and systems in the curriculum coupled with embedded internship or co-operative experiential learning modules to prepare for employment in medtech industry. Real life experiential learning thru placement at a medtech industry or a teaching hospital undoubtedly complements the knowledge and competencies acquired on campus. BME program directors should make special efforts to recruit and retain dedicated faculty and technical staff. Continuing support of resources are necessary for the successful execution of the academic programs. The curricula for the proposed models have been developed in different academic settings and implemented. Extensive experience in designing and directing multiple models for BME undergraduate education lends support to the success of carefully designed site-specific programs to prepare the students for the medtech industry involving medical devices and systems.

SP010.5 - BME vs CE vs HTM vs HbHTA vs EAM. What's in a Name and does it matter?

Author(s): Mladen A. Poluta

Human Biology (bme Division), University of Cape Town, Observatory/SOUTH AFRICA

Background:

Technology is increasingly an essential component of effective healthcare delivery in diverse settings. Ensuring that healthcare technologies are optimally planned, assessed, acquired, implemented, managed and replaced is a complex process involving many stakeholders and players. While the adage "Don't fix what ain't broke" applies in the context of established practices in different jurisdictions, it is nevertheless important to consider where we stand collectively. Greater alignment, clarity of purpose and standardisation - as well as a common future vision - would support stakeholder engagement, demystify guidance to countries (especially those that are resource-challenged), support capacity building and facilitate both achievement of critical mass in diverse settings and mobilisation of resources for related activities. This paper provides one perspective of the status quo and makes some suggestions for the way forward, with a focus on engineering/technical disciplines related to healthcare technologies.

Issues:

How can we address the lack of uniformity in both nomenclature and practice? For example, BME is often seen as synonymous with CE, but not universally so, and both are referred to by other terms.

What are the generic international classifications pertaining to BME and CE? (Ref: ISCO-08)

How can recognition to be given to the full range of engineering professionals: engineers, technologists and technicians? (Ref: Washington-, Sydney- and Dublin Accords of the International Engineering Alliance)

How different is HTM from Clinical Engineering, and both HTM and CE from the emerging fields of Hospital-based HTA and Engineering Asset Management, respectively?

What are the individual 'value-adds' and focus/impact areas for BME, CE, HTM, HbHTA and EAM, and is there merit in unifying/ aligning these disciplines?

Figure 1 below shows how the disciplines/specialities addressed could combine in serving a common purpose, while recognising their specific roles and contributions to the overall process.

Figure 1: Optimised Life-Cycle management of Healthcare technologies, showing the contribution of supporting disciplines, specialities and fields.

SP010.6 - Clinical Engineering Certification Program in the Americas

Author(s): Frank R. Painter

Biomedical Engineering, University of Connecticut, Trumbull/UNIT-ED STATES OF AMERICA

The American College of Clinical Engineering's (ACCE) definition of a clinical engineer is a professional who supports and advances patient care by applying engineering and managerial skills to healthcare technology. One of ACCE's mission statements is to define a body of knowledge on which the profession is based. Using the definition and the information received from a body of knowledge survey sent to over 500 practicing clinical engineers from around the world, in 1990 a clinical engineering certification exam was created.

The Healthcare Technology Certification Commission (HTCC)was formed to oversee the process and a Board of Examiners was formed to create the exam and test the candidates. The financial aspects of the certification process are managed by ACCE on behalf of the HTCC.

After several years it became apparent that the process could be adopted by other countries. In 1995 the Canadian Board of Examiners was formed and the CCE exam became a collaborative process between the Canadian and US Board of Examiners. In the meantime collaboration with several countries in South and Central America as well as the Middle East has been discussed.

The exam process includes of three major components; the application, written exam and oral exam. The application process consists of the simple application, university transcript and three professional references. Through this the candidate must demonstrate they have sufficient clinical engineering experience to qualify to take the exam. The exam consists of 150 multiple choice questions distributed across CE topics in the same proportion as they appear in the body of knowledge survey results. The oral exam is a structured exam questioning the candidate on three separate real life clinical engineering scenarios.

The Board of Examiners publish an application and a handbook to guide the candidate through the process. These are available on the certification page of the ACCE website (www.accenet.org). This page also includes information on the CCE renewal process, recommended resources for use in preparing for the exam and a list of those currently certified. 221 certified clinical engineers are currently listed.

SP010.7 - Biomedical Technology Online Courses for the Americas

Author(s): <u>Tobey Clark</u>¹, Alexandre Lemgruber², Francisco Caccavo², Tatiana Molina Velasquez³, Federico Gracia⁴, Rossana Rivas⁵, Luis Vilcahuaman⁶

¹Instrumentation & Technical Services, University of Vermont, Burlington/UNITED STATES OF AMERICA, ²Health Technologies, Pan American Health Organization, Washington DC/UNITED STATES OF AMERICA,³Universidad CES, Medellin/COLOMBIA, ⁴Universidad Tecnológica Nacional – Facultad Regional Mendoza, Mendoza/AR-GENTINA, ⁵Health Technopole CENGETS PUCP, Lima/PERU, ⁶Bioengineering Laboratory, Bme Ms Program, Pontifical Catholic University of Peru, Lima/PERU

Latin America and the Caribbean countries are rapidly expanding their healthcare technology usage. Physicians, patients and their families are understanding better the relevant influence of healthcare technology based on clinical, ethical, social, and economic health outcomes. Companies are eager to expand to this growing area, and donations from developed countries of new and used equipment continue.

In general, the regional status of Latin American and Caribbean countries includes: little medical device regulations, a high percentage of devices that are out of service, weak after sale device support with nearly all service from manufacturers or their representatives, a shortage of technical staff in hospitals, very limited maintenance budget, inadequate number of healthcare staff appropriated trained and limited technology management.

What is needed is training and education of staff at the hospital level in the various technologies used in healthcare. Education and training of clinical and technical staff interacting with medical technology enhances the effectiveness and safety of medical care.

Through a grant from the PAHO Foundation (formerly PAHEF), biomedical technology online courses were developed for clinical and technical staff. Online training via the Internet allows 24x7 accesses to training resources in an asynchronous fashion. Extensive use of web resources and simulations enhance the courses. The course topics include anatomy/physiology, engineering concepts, physiological monitors, cardiac therapy devices, ventilators, infusion technology, all imaging modalities, surgical systems, clinical information networks, and therapy devices. The initial English version has been taught in the USA since 2007. The courses were translated to Spanish and adapted for use in Latin America for use in 2008. Over 1000 students from 28 countries have taken the courses at the University of Vermont USA, Universidad CES in Colombia, Universidad Tecnológica Nacional - Facultad Regional Mendoza in Argentina, and Pontificia Universidad Católica del Perú.

In September 2014, the online courses were placed on the PAHO

Virtual Campus for Public Health. The PAHO Virtual Campus for Public Health with over 100 courses offered currently has students from over 140 institutions enrolled from the Americas. The PAHO platform allows a broader range of students from the Americas to enroll in the courses especially those without the funds for university courses. Forty-eight students from twenty-one countries enrolled in the twenty-four week English and Spanish courses – Introduction to Biomedical Technology. Course assessments and evaluation will be available following the end of course on April 24th and will be presented at the WC2015. Future plans are for translation of the courses to Portuguese and adaptation to Brazil, and additional educational offerings on healthcare technology planning and management.

SP011 - Overview of Gender Roles in Medical Physics in North America

TRACK 18: GENDER, SCIENCE AND TECHNOLOGY

SP011.1 - Gender, Science and Technology: The Role of Women in Medical Physics

Author(s): Kristy K. Brock

Radiation Oncology, University of Michigan, Ann Arbor/MI/UNITED STATES OF AMERICA

The role of women in the field of medical physics has been steadily increasing over time. Data obtained from the AAPM shows that the women comprise an increasing percentage of the overall membership. In the late 1960s, less than 10% of the membership was female, however this has been steadily increasing and in 2014, 21% of the full membership is female and 29% of the overall membership (including student members) is female. If this trend continues at the same rate, by 2044 we would expect equal representation of males and females in the field. It is important to not only evaluate the membership, but also the engagement of women within the active membership and leadership positions within the field and professional society. AAPM staff assisted in mining the membership database for statistics on gender representation in the society membership, engagement in the AAPM, presentations at the annual AAPM meeting, and AAPM leadership. Full membership was used as the gender baseline as student members are not allowed to serve on committees, however they do present at the annual meeting. Engagement in the AAPM was classified as membership on an AAPM committee, which has the structure of 3 councils (Professional, Educational, and Science) under which there are several committees, subcommittees, working groups, and task groups. Presentations at the annual meeting were evaluated based on authorship, first author presenting a poster, first author presenting at the podium (oral), session moderators, invited speakers, and invited speakers in the educational, professional, and scientific track. Presentation data was obtained over the past 5 meetings (2009-2014). Leadership in the AAPM is defined as members of the Board of Directors (nominated by a committee and elected by the full membership or elected from a local chapter), membership on the Executive Committee (nominated by a committee and elected by the full membership), and President (nominated by a committee and elected by the full membership). Gender representation in distinguished awards given by the society was also evaluated.

Of the AAPM membership currently serving on a committee, working group, or task group, 21% are female, the same ratio of women in the AAPM membership. Further evaluation of 'very active' members, defined as membership in 5 or more committees, found that this representation is maintained, with 20% of very active members being female.

Evaluation of the past 10 AAPM annual meeting shows that of the over 60,000 authors of AAPM abstracts, 16% were female. 20% of the 6,794 poster presentations were given by women and 18% of 6,947 oral presentations were given by women. Abstracts acceptance and placement in a poster or oral session (highest scored abstracts) are based on single blind reviews (authors' names are known to the reviewers). Session moderators are selected by the scientific program committee and of the 451 moderators over the past 10 years, 16% were female. The AAPM Meeting Coordination Committee invites speakers for educational, professional and scientific sessions. Over the past 10 years, 17% of the invited speakers in educations sessions have been female, 23% in the professional

session, and 12% in the scientific session (however 10% of the scientific session speakers did not have a disclosed gender, likely due to not being a member of the AAPM organization).

The current Board of Directors for AAPM is comprised of 46 individuals, 10 of whom are female (22%). Historically, of the 18 Secretaries of the AAPM, 2 have been women (11%) and 7 of the 15 Treasurers have been women (47%). There have been 57 presidents of the AAPM society, 3 of whom have been women (5%). The first female president of the AAPM was in 1982, the last 2 in 2007 and 2009. Of the 897 awards bestowed by the AAPM, 9% have been awarded to women. The William D. Coolidge Award recognizes 'an AAPM member for an eminent career in medical physics. It is the highest award given by the AAPM' and has only been awarded to one woman, in 1977.

These trends show promising inclusion of women in medical physics. The increase in the number of women pursuing careers in medical physics is evident by the steady increase in the percentage of women making up the membership. It is encouraging to see that this rate of women entering the field is also matched by active engagement in the society (through membership on committees) and emerging in leadership, as seen in membership of the Board of Directors, however not yet matched at the presidential level.

Learning Objectives:

1. Highlight the role of women in Medical Physics.

2. Evaluate the engagment of women in the American Association of Physicists in Medicine.

3. Understand gender related issues in science and technology fields.

SP011.2 - Biography of Women in Medical Physics: Maryellen Giger, Ph.D.

Author(s): Maryellen L. Giger

Radiology/medical Physics, University of Chicago, Chicago/UNITED STATES OF AMERICA

My brothers and I were first-generation college and were raised with the importance of education. Following the completion of my Bachelor's Degree in Mathematics, Physics, and Health Sciences from the Illinois Benedictine College, I studied Physics at the University of Exeter, earning a Master's Degree. This experience led me to the University of Chicago to study Medical Physics, where I earned my PhD in 1985. I continued my tenure at the University of Chicago becoming faculty in 1986 in the Department of Radiology. At the University of Chicago, I have served as Director of the Advanced Imaging Program in the Cancer Research Center, Director of our CAMPEP-accredited Graduate Program in Medical Physics, and Chair of the Committee on Medical Physics. I am currently the A. N. Pritzker Professor of Radiology/Medical Physics and Director of the BSD Imaging Research Institute at the University. My passion for medical physics began while working summers during college at Fermi National Laboratories where I assisted in the beam diagnostic group and the neutron therapy group. I have also served as President (and Chairman of the Board) of the American Association of Physicists in Medicine, Board member of SPIE, and Editor-in-Chief of the SPIE Journal of Medical Imaging. I am a Fellow of AAPM, AIMBE, and SPIE. I was honored to be elected to the National Academy of Engineering and to be named by the International Congress on Medical Physics as one of the 50 medical physicists with the most impact on the field in the last 50 years. I feel that my most significant scientific achievement was providing leading contributions to the field of computer-aided diagnosis. I have more than 170 peer-reviewed publications (over 300 publications), more than 30 patents, and mentored over 100 graduate students, residents, medical students, and undergraduate students. Also, my husband and I have raised our four children through various trips to AAPM, SPIE, and other scientific meetings. The best part of my "job" is when my student becomes a colleague. I look forward to sharing my experience at the World Congress.

SP011.3 - My STEM story: from Martinique in the Caribbean to Quebec City, through France and Vietnam Author(s): <u>Nadia Octave</u>

Radiation Oncology, CHU de Québec, Québec/QC/CANADA

It is always a bit intimidating to be asked to come forward to talk about one's personal life, experiences and career path. Someone said stories can move people and inspire them. That is for big stories, I would say. My aim would be just to send seeds in the wind and who knows? May be one will bear fruits? So to start, I am a medical physicist born and raised in Martinique, a French region in the Caribbean. I have a biomedical engineering background with a master in medical technologies from Toulouse Paul Sabatier University, and a specialization in radiation physics and imaging. Two long-term internships in Toronto had a major impact on my following choices and did actually prove to influence all the rest of my career path until my current job position in Quebec City. But that is a long story that I cannot tell in a few words, because I would have to start with the very beginning: my thirst for knowledge of the human body and its biology and my first interest in physics with the moon and astronomy. To this I have to add, the meeting of important role models and mentors to whom I could always refer and who could share their own experiences with me. Also I could tell you about my years of training at the Curie Institute, at the Gustave Roussy Institute and my first position as a junior medical physicist at the Georges Pompidou European Hospital in Paris and also about an experience within the experience working in Vietnam. But more importantly I would like to emphasize on the challenges and obstacles that I overcame. I will also share some strategies that worked for me so that you too can be convinced that the only limits are the ones that we imposed to ourselves. And finally, since stories without actions are meaningless, I will speak about an initiative here today.

SP011.4 - My strategies for living (and enjoying) academic research

Author(s): <u>Rebecca Fahrig</u>

Radiology, Stanford University, Stanford/CA/UNITED STATES OF AMERICA

During the completion of my Bachelor's degree in Physics at the University of Toronto, I became interested in Medical Physics, which led me to pursue a Master's in Medical Biophysics from the University of Toronto. I completed my PhD in Medical Biophysics from the University of Western Ontario, where I focused on novel x-ray imaging techniques. I was awarded a Post-Doctoral Fellowship by the Medical Research Council of Canada, which I completed at Stanford University. Following my fellowship, I joined the faculty at Stanford School of Medicine, where I am currently a Professor (Research) of Radiology. I have had the honor of receiving the Young Investigator's Award from the American Association of Physicists in Medicine, and the Greenfield Award for Best Paper published in Medical Physics. I have published over 100 peer reviewed articles and I am currently the PI on two NIH funded grants. At each stage of my career I have been fortunate to have mentors who have provided sage advice and guidance. I look forward to an exciting World Congress and the opportunity to share my experience in the Gender, Science, and Technology Track.

SP011.5 - Early exposure to science leads to fulfilling career in medical physics

Author(s): Renee X. Larouche

Radio-oncologie, CHUM - Hôpital Notre-Dame, Montreal/CANADA

I have a happy and fulfilling career working in the field of clinical medical physics for almost 13 years. Although I love my work, finding the perfect balance between work, family life, and volunteering is not an easy task to accomplish. After working in two community radiation oncology clinics, one in Canada and the other in the USA, I finally settled in Montreal. I am now currently employed at the Centre hospitalier de l'Université de Montréal (CHUM- Notre-Dame hospital) in the department of radiation oncology. My general interests are in safety and risk management as well as the implementation of more robust processes in the clinic. Since 2012, I am the Deputy Chief Examiner for the Canadian College of Physicists in Medicine (CCPM). This opportunity allows me to meet a number of young medical physicists from all across Canada.

My life experience in the world of sciences has been very positive. I have received encouragement, worked in nurturing conditions and have had great role models. I was exposed to physics at a very young age when a neighbor who was a physicist recognized my interest in science and nurtured it. In high school, I enrolled in a special science program. This constructive early exposure to science kept me motivated.

We were only three female students majoring in undergraduate physics. The gender issue had never been so obvious. The small number of women did not impact my sense of belonging. Although I felt lonely at times, I wanted to be a physicist just as much as anyone else in that classroom. Fortunately, I met a group of young women enrolled in science or engineering programs and we founded a campus chapter of Women in Science and Engineering (WISE). This was a great time in my life: in fact, a friend I made through WISE is now my daughter's godmother.

As a graduate student in medical physics, I realized that confidence plays a major role when expressing your ideas. Indeed, more importance was given to oral expression during exams than when I was an undergraduate student: I had never experienced the somewhat daunting situation of being questioned by a panel of examiners orally before. I will always remember the stress and fear associated with these exams, but I found that being well prepared and organized was key and is still the solution in my case. I keep this in mind when preparing oral exams for the CCPM.

Fear is often a hurdle for someone to attain his or her potential: fear of not succeeding, fear of ridicule or fear of rejection. The truth is that you are letting yourself down when deciding not to try. Getting out there, pushing yourself is how you are able to develop and, looking back, be proud of what you have accomplished.

SP013 - MRI: Methods

TRACK 01: IMAGING

SP013.1 - Numerical Simpson's Rule for Real Time and Accurate T2* maps generation Using 3D Quantitative GRE Author(s): <u>Chemseddine Fatnassi</u>¹, Rachid Boucenna¹, Habib Zaidi² ¹Radio-oncology Department, Hirslanden, Lausanne/SWITZER-LAND, ²Department Of Nuclear Medicine And Molecular Imaging, Geneva University Hospital, Geneva/SWITZERLAND

Introduction: Quantitative T2* maps can be generated using different approaches, the golden standard being the nonlinear least square (NLLS) exponential signal decay fitting technique. It can be also be generated using a logarithmic linear fit (LLf). However, the above mentioned methods based on curve fitting are time consuming and their use in real time challenging. NumART2* approach introduced by Hagberg et al. (2002) computes in real time the T2* but remains echo spacing and signal noise dependent. In this work, we propose an alternative approach relying on Simpson's rule integration that generates in real time accurate T2* maps even in the presence of large echo spacing and high noise value.

Materials and Methods: We propose a method based on Simpson's rule for integrating the temporal signal decay. Instead of a linear approximation (e.g. NumART2*), Simpson's rule combines trapezoidal and midpoint rules to better interpolate the signal decay between echoes. To test our hypothesis, we used simulated brain MRI data (MNI, Canada) and 20 *in vivo* scans performed on a 3T Magnetom Trio (Siemens Healthcare, Erlangen, Germany) using the following parameters: Echoes/GRE/ α /TR/TE1/ Δ TE/size=32/Bipolar/8°/47/ 1.23/1.23ms/136×136×112. An offline generation of T2* was realized using LLf, NLLS (expo) and NumART2*. The maps were evaluated and compared in terms of signal echo spacing and image noise level.

Results and Discussion: In the presence of small echo spacing $(\Delta TE/T2^*) < 0.2$), the T2^{*} maps were well generated by all methods, with a slight overestimation when using NumART2*. When ΔTE increases (ΔTE/T2*)>0.2), NumART2* tends to overestimate the T2* values, although accuracy is well maintained by the other methods. These results can be explained by the quadratic interpolation of signal decay between the echoes that Simpson's rule uses to approximate the area under the signal decay rather than a linear approximation that NumART2* uses. For low noise levels (<15%), all methods provide highly accuracy results. NumART2* starts to diverge when the noise level becomes significant (>15%), while Simpson's rule, linear and NLLS fit remain insensitive to added noise. Simpson's rule combines two approximations, namely the midPoint and trapezoidal rules, to compute the signal integral. This combination enables to approximate well the signal decay between two echo points using a smooth guadratic interpolation even in the presence of high noise level, and as such, provides accurate T2* maps.

Conclusion: We proposed an alternative T2* maps generation which relies on Simpson's rule to approximate the geometric area under the signal decay. The method allows rapid whole brain mapping of T2* with a high accuracy even in the presence of large echo spacing or high noise level.

SP013.2 - Optimization of Pulse-Triggered fMRI Measurement Delay with Acoustic Stimulation

Author(s): Anita Król¹, <u>Zofia Drzazga</u>¹, Uwe Klose² ¹Medical Physics, A Chelkowski Institute of Physics, University of Silesia, Katowice/POLAND, ²Diagnostic And Interventional Neuroradiology, University Hospital Tübingen, Tübingen/GERMANY

The purpose of the study was to examine whether improvement of activation maps of auditory cortex and brainstem nuclei is possible when the delay between the cardiac induced pulse signal and the measurements is optimized. Subsequently, the comparison of the height of brain activity obtained for different stimuli- classical and rock music. In five healthy, right- handed volunteers (the mean ages 25.4 ± 2.8 years old), musical stimuli were presented binaurally in a block design. Evaluation was performed using 'Matlab' and 'SPM-8new' software with statistical threshold p< 0.001 (auditory cortex, AC) and pu< 0.01 (brainstem). Our results suggest that the manipulation of the trigger delay (TD) time changes the degree of activation in auditory cortex and brainstem nuclei. Detection of auditory cortex was in 16% (TD=0), 30% (TD=200), 8% (TD=400) and 9% (TD=800) higher than without cardiac gating examinations, and correspond to the 41 and 22 Brodmann areas. The 3-selected slices volume included the medial geniculate bodies (MGB), lateral lemniscus nuclei (NLL), superior olivary complex (SOC) and cochlear nuclei (CN). The height of activation depends on duration of trigger delay. Therefore, using various TD time proves that it is possible to increase ability to detect activation in subcortical auditory structures - another method to reduce image signal variability, which was caused by brainstem motion. Examinations with rock type of music bring better than examinations using classical music.

SP013.3 - Improvement of Pseudo Multispectral Classification of Brain MR Images

Author(s): <u>Chemseddine Fatnassi</u>¹, Rachid Boucenna¹, Habib Zaidi² ¹Radio-oncology Department, Hirslanden, Lausanne/SWITZER-LAND, ²Department Of Nuclear Medicine And Molecular Imaging, Geneva University Hospital, Geneva/SWITZERLAND

Introduction: Several advanced applications using morphological MRI frequently require segmentation of the imaged volumes. The accurate interpretation of information pertaining to investigation of brain alterations relies on accurate and reproducible brain tissue classification. Different approaches based on thresholding, cluster analysis, a priori information about anatomy and Bayesian classification have been proposed. However, many of them fail when classifying specific regions with low contrast between tissues. In this work, we introduce an enhanced method to classify brain tissue by combining a pseudo-multispectral color transformation (PMC) and improved K-mean clustering. The proposed approach is compared with FSL classification (FMRIB, Oxford, UK).

Materials and Methods: Gray and binary color spaces are commonly used by image processing methods. However, the contrast between brain tissues in some regions is very low e.g. cerebellum(WM and GM interfaces). Consequently, methods fail and wrong classifications might occur. To overcome this problem, the first step consists, after skull stripping, in transforming the T1-MPRAGE data to multispectral data containing 3 different images CIE-XYZ. To better separate neighboring values in WM, GM interfaces, normalized 3-channel data values are weighted by root square function (RSF). RSF minimizes low contrast region brain tissue overlapping. In the second step, an enhanced iterative and non-deterministic K-mean clustering is applied for image classification. The number of K-clusters is initially set to be maximal; the algorithm repeats classification with decreasing K until convergence. Subsequently, gap criterion, used to evaluate the optimal number of clusters, is calculated. Optimal K-cluster is then estimated. In addition, GM, WM and CSF centroid distribution templates are

estimated beforehand using more than 70 human and a couple of simulated data. Based on these parameters, brain tissue classes computed earlier are corrected and reassigned to the new optimal classes. To evaluate our approach, we used 4 numerical brain atlas templates where GM, WM and CSF volumes are known beforehand (ground truth). In addition, 10 clinical MRI studies scanned on a 3T Skyra (Siemens Healthcare, Germany) using T1-MPRAGE sequence with the following parameters: flip/TE/TR/TI/=100/4/9.7/20ms. These data sets were classified using PMC and then compared with FSL classification.

Results and Discussion: The numerical brain tissues are classified using the enhanced PMC algorithm with a high accuracy (108% for WM, 101% for GM and 108% for CSF) against FAST-FSL (85% for WM, 119% for GM and 86% for CSF). Silhouette plot indicates that PMC better separates clusters compared to FAST-FSL classification without any tissue misclassification even in presence of low CNR and partial volume effect. The clinical studies show that the proposed approach is faster and more accurate, especially in region with low CNR e.g. cerebellum arbor vitae where the WM and GM are better delineated.

Conclusion: It can be concluded that enhanced PMC classification provides a fast and accurate brain tissue classification. This approach overcomes the low CNR and partial volume effect present in some brain regions, e.g. cerebellum arbor vitae and near the temporal lobe region and seems to be promising for clinical and research applications.

SP013.4 - Image reconstruction of RF encoded MRI signals in an inhomogeneous B0 field

Author(s): <u>Somaie Salajeghe</u>¹, Paul Babyn², Jonathan C. Sharp³, Gordon E. Sarty¹

¹Biomedical Engineering, University of Saskatchewan, Saskatoon/ CANADA, ²University of Saskatchewan, Saskatoon/CANADA, ³University of Alberta, Edmonton/CANADA

Introduction: Conventional Magnetic Resonance Imagers (MRI) use a uniform main magnetic field (B0) to polarize the sample being imaged. Non-homogeneity in the B0 field leads to image distortion. In practice it is impossible to have a perfectly homogeneous B0 field so shim coils are used to remove the inhomogeneity of the field. However, shim coils and other B0 homogeneity requirements result in expensive and heavy MRIs. To produce truly portable MRI equipment, the requirements for homogeneity of the B0 field could be removed. When used with TRansmit Array Spatial Encoding (TRASE) [1] to encode information instead of using traditional B0 gradient coils an MRI with an inhomogeneous field could be portable [2]. The TRASE method encodes spatial information through the use of spatially varying B1 transmit phase fields. The feasibility of the reconstruction of TRASE signals under B0inhomogeneity from a mathematical perspective was investigated.

Method: TRASE signals were simulated for a discrete Shepp and Logan mathematical phantom inside a TRASE RF coil set, composed of a combination of circular Maxwell and Helmholtz coils, in an inhomogeneous B0 field. The field assumed was $B0(x,y) = Ax^2 + By^2 + C$ where A = 0.1, B = 0.2 and C = 0.08. The simulated TRASE MRI signals were reconstructed using a regularized least squares reconstruction method. The signal from the phantom ρ may be written in matrix form, with appropriate re-indexing of the collected signal data points, as $S = [T]\rho$. The image may then be reconstructed using constrained least squares technique. Here a regularized least squares reconstruction was done by adding Tikhonov regularization as $R = argmin (||[T]R - S||^2 + ||\mu[I]R||^2)$, where μ is a regularization parameter, [I] is the identity matrix and R gives the approximate solution for ρ .

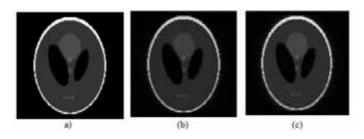

Fig. 1: 128 *128pixel phantom and reconstructions. (a) Phantom. (b) Reconstructed image from a TRASE signal generated in a homogeneous B0 field. (c) Reconstructed image from a TRASE signal in an inhomogeneous B0 field.

Results/Conclusion: Fig. 1 shows regularized least squares inversion of simulated signals from a TRASE coil in an inhomogeneous B0 field. The result is comparable to the reconstruction from a signal generated in a homogeneous B0 field. This is the first step in showing that TRASE in an arbitrary B0 field is possible. The next steps include simulations via the Bloch equations to model the effect of inhomogeneties on the flip angles attained.

SP014 - Bone Mechanics

TRACK 03: BIOMECHANICS AND ARTIFICIAL ORGANS

SP014.2 - Improved Semi-automated 3D Kinematic Measurement of Total Knee Arthroplasty Using X-ray Fluoroscopic Images

Author(s): <u>Takaharu Yamazaki</u>¹, Ryogo Kamei², Tetsuya Tomita³, Yoshinobu Sato⁴, Hideki Yoshikawa⁵, Kazuomi Sugamoto³ ¹The Center For Advanced Medical Engineering And Informatics, Osaka University, Osaka/JAPAN, ²Ritsumeikan University, Shiga/JA-PAN, ³Orthopaedic Biomaterial Science, Osaka University Graduate School of Medicine, Osaka/JAPAN, ⁴Nara Institute of Science and Technology, Nara/JAPAN, ⁵Orthopaedics, Osaka University Graduate School of Medicine, Osaka/JAPAN

Accurate measurement of 3D dynamic kinematics of total knee arthroplasty (TKA) is very important for evaluating the outcome of surgical procedures and for improving the implants design and clinical outcome. In order to achieve 3D kinematic analysis of TKA, 2D/3D registration techniques, which use X-ray fluoroscopic images and computer aided design (CAD) model of the knee implants, have been applied to clinical cases. However, in previous study, these techniques have needed time-consuming and labor-intensive manual operations in some process, and particularly the process of the manual initial guess poses of the CAD model for each X-ray image was problem for practical clinical applications. In this study, we propose an improved method for semi-automated 3D kinematic measurement of TKA using X-ray fluoroscopic images. The proposed initial pose estimation method of the model is based on the use of a transformation with feature points extracted from each X-ray image using speeded up robust features algorithm. In order to ensure the validity of the proposed method, in vivo experiment using X-ray fluoroscopic images of 4 TKA patients during knee motions was performed. As a result of experiment, 3D pose of the model for all X-ray images except for the first frame was automatically stably-estimated, and the success rate (X-ray frame number within error of 1mm / 1 degree relative to all X-ray frame number) for the femoral and tibial component were 83.7 % and 73.5 %, respectively. In addition, the success rate with the proposed method was higher than a conventional method. Consequently, the present method was thought to be very helpful for practical clinical applications.

SP014.3 - The influence of screw length and stiffness on the tibial mechanical environment in ACL reconstruction Author(s): Jie Yao¹, Lizhen Wang¹, Yubo Fan^{*2}

¹School of Biological Science and Medical Engineering, Key Laboratory for Biomechanics and Mechanobiology of Ministry of Education, National Key Lab of Virtual Reality Technology, Beihang University, Beijing/CHINA,²National Research Center for Rehabilitation Technical Aids, Beijing/CHINA

Introduction & Objective

Anterior cruciate ligament (ACL) reconstruction is the primary treatment for the ACL injury in orthopedics. However, the post-operative graft laxity has been frequently reported, which would cause knee instability and osteoarthritis in long-term [1]. The interference screw is the popular implant for the graft fixation. It may change the surrounding mechanical environment, induce the undesirable bone remodeling, and lower the graft fixation strength. Therefore, this study aimed to quantify the influence of the screw on the distribution of stress energy density (SED),which correlated with the bone remodeling.

Methods

The finite element model of single-bundle ACL reconstruction was developed. The SED distributions in tibia under the compressive, valgus, and rotational loadings were applied. The influences of the screw length and stiffness on the post-operative SED were calculated.

Results & Discussion

The compressive loading played an predominant role among the three loadings. Under the compressive loading, the SED beneath the screw shaft was decreased, whereas the SED above the screw shaft was increased. Extremely high SED occurred near the screw head and tip.

Increasing the screw length would potentially promote the bone healing at the proximal part of the tunnel, yet aggravate the SED alteration at the distal part. Using a screw modulus approaching to the bone could reduce the undesirable SED alteration.

Conclusion

In ACL reconstruction, using a long screw with the modulus approaching to the bone could provide a beneficial mechanical environment for the post-operative rehabilitation.

Acknowledgment

The present study was supported by grants from National Natural Science Foundation of China (NSFC 11421202, 11120101001), and National Science & Technology Pillar Program of China (2012BAI18B07, 2012BAI22B02).

SP014.4 - A new method for determining the effect of follower load on the range of motions in the lumbar spine

Author(s): <u>Cheng-Fei Du</u>¹, Junchao Guo¹, Yun-Peng Huang², Yubo Fan*³

¹School of Biological Science and Medical Engineering, Bei-hang University, Beijing/CHINA, ²Department Of Orthopaedics, First Affiliated Hospital, FuZhou/CHINA, ³School of Biological Science and Medical Engineering, Key Laboratory for Biomechanics and Mechanobiology of Ministry of Education, National Key Lab of Virtual Reality Technology, Beihang University, Beijing/CHINA

In this study, a new method of applying follower load in finite element (FE) model of lumbar spine was presented. The effect of follower load on the range of motions (ROM) in lumbar spine was also investigated. A three-dimensional nonlinear FE model of lumbar spine (L1-S1) has been developed and validated. Connector elements between each pair of endplates were created to apply follower load. The endpoints of each connector were close to the center of endplate. The follower load of 0N, 500N, 800N, 1200N were respectively applied to explore their influence on the motion response of lumbar spine to the moment of 7.5NM in three principle planes (extension, flexion, right bending, left bending, right torsion, left torsion). The results showed that the direction of follower load was almost along with the curvature of spine and induced very small segmental motion. The follower load made the ROM of lumbar spine slightly increase in extension, while produced the decrease in ROM in other five moments. This stiffening effect became more obvious with an increase in the follower load. The largest percent decrease in motion of lumbar spine due to pre-load was in left torsion (47%),and then right torsion(42%), right lateral bending (21%), left lateral bending(20%), flexion(11%).

SP015.1 - Beta Enhancers: towards a local dose enhancer device for Boron Neutron Capture Therapy (BNCT) on superficial tumors

Author(s): Esteban F. Boggio¹, Juan Longhino¹, Lucas Provenzano², Rubén Farías², Sara González², Susana Nievas³, Alejandra Dagrosa² ¹Reactor And Radiation Physics - Bariloche Atomic Center, Atomic Energy National Comission, San Carlos de Bariloche/ARGENTI-NA, ²National Council of Scientific and Technical Research, Ciudad Autónoma de Buenos Aires/ARGENTINA, ³Constituyentes Atomic Center, Atomic Energy National Commission, Buenos Aires/ARGEN-TINA

Introduction. BNCT is a cancerous cells selective, non-conventional radiotherapy modality to treat malignant tumors such as glioblastoma, melanoma and recurrent head and neck cancer. It consists of a two-step procedure: first, the patient is injected with a tumor localizing drug containing a non-radioactive isotope (Boron-10) with high slow neutron capture cross-section. In a second step, the patient is irradiated with neutrons, which are absorbed by the Boron-10 agent with the subsequently nuclear reaction B-10(n,a)Li-7, thereby resulting in dose at cellular level due to the resulting high-LET particles. The Argentine clinical facility for superficial tumors treatment is located at the RA-6 Research Reactor (Bariloche Atomic Center). The neutron beam designed provides a slow neutron flux maximum at approximately 1 cm depth. Due to the penetration of the beam, the total absorbed dose in the first few millimeters of the tissue is lower than in the maximum. Thus, the introduction of a suitable device over the irradiated area to allow a local dose increase without substantially perturbing the primary in-depth dose profile is considered in this work. Some materials for the suggested devices such as Rhodium, Silver and Indium have advantageous properties: a high neutron capture cross-section with fast decay activation products and high energy beta particles emission. As beta radiation has a short penetration range in tissue, it can be used to compensate the superficial dose gradient of the BNCT treatment, or even increase it significantly. These devices are called Beta Enhancers (BE).

Material and Methods. BE are modeled in Monte Carlo (MCNP). with their own characteristic beta emission for each case, to determine those candidates that minimize perturbation effects in the original therapeutic beam and significantly improve the local depth absorbed dose profiles. In order to validate these models, experimental measurements are carried out using radiochromic films and thermoluminescence detectors (TLD) in-depth of a solid phantom with BE positioned on their surface. The validated particle sources are then evaluated in the retrospective treatment planning of selected nodular melanoma treatments of the Argentine BNCT patients. Finally, BE were implemented in a Nude mice cancer model for BNCT that were carried out at the RA-6 facility, in order to preliminarily assess toxicity and efficacy. Nude mice were separated into five groups of 6-9 animals each one: control group, NCT (without boron agent) irradiation, NCT + BE irradiation, BNCT irradiation and BNCT + BE irradiation.

Results. The simulations and its experimental correlations show good agreement, validating thus the computational models of the BE particle sources. Retrospective patient treatment planning and Dose-Volume Histograms show considerably improvement of the local absorbed dose on the treated cancerous tissue. Nude mice cancer model experiment demonstrated the BE efficacy, especially between NCT group and NCT + BE groups. There was no evidence of toxicity. **Conclusions.** Beta Enhancers show to be a complementary tool to improve the BNCT of very superficial tumors cases, without significant perturbation of the primary neutron beam used for the treatment.

SP015.2 - Nanoparticle Enhanced Radiation Therapies: Is There a Synergy with Chemotherapies?

Author(s): Linda J. Rogers¹, Herman Hau², Wojciech Chrzanowski², David R. Mckenzie³, Natalka Suchowerska¹

¹Radiation Oncology, Chris O'Brien Lifehouse, Sydney/AUSTRA-LIA, ²Faculty Of Pharmacy, University of Sydney, Sydney/AUSTRA-LIA, ³School Of Physics, University of Sydney, Sydney/AUSTRALIA

Introduction

Nanoparticles can enhance the radiation dose, but have exhibited cytotoxicity, which is highly dependent on the ability of nanoparticles to penetrate the cell membrane and accumulate within the cell. Both radiation enhancement and nanoparticle uptake is regulated by the nanoparticle surface characteristics, their size and chemical composition. The goal of this study is to identify the individual and combined synergistic toxicity of radiation therapy and chemotherapy with gold nanoparticles (GNPs). The existence of a synergy would enable the radiation dose and the systemic dose from chemotherapy drugs to be reduced, thereby reducing side effects. Local treatment efficacy, through the synergistic coupling with nanoparticles, would be enhanced.

Method

For the human colon adenocarcinoma (LoVo) cell line, the clonogenic survival response was determined for a 50 kVp beam produced by a Pantak and a 6 MV beam produced by a Varian Novalis linear accelerator, for the chemotherapy drug 5-fluorouracil (5-FU) and for GNPs of diameter 4 nm for a range of concentrations. The GNPs were manufactured using precipitation method and stabilised with PEG. The therapies were combined in pairs to identify individual synergies first, then all three (radiotherapy, nanoparticles and chemotherapeutic) were combined to establish cumulative effects.

Results

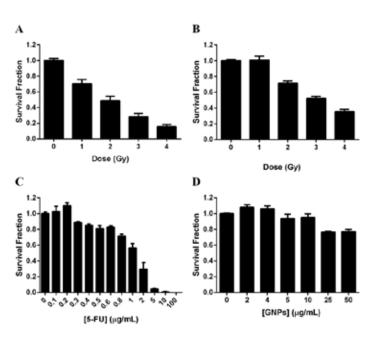

Figure 1: Clonogenic cell survival dose response of LoVo cells to A: 50kVp radiation beam; B: 6MV radiation beam; C:5-FU; and D:GNPs.

Radiation doses for both energy beams and concentrations of GNPs and 5-FU were chosen such that in combination a paired total loss in cell survival was predicted on the basis of no synergistic effects to be of approximately 50%. The doses used were 1 Gy (kV radiation), 2 Gy (MV radiation), 0.5 μ g/mL 5-FU and 50 μ g/mL GNPs. It was found that the cells are more sensitive in the kV beam than in the MV beam for the same dose (Figure 1A & 1B), the result of differences in LET. The 5-FU and GNPs at very low doses appear to cause an increase in clonogenic survival however this is not statistically significant.

Conclusion

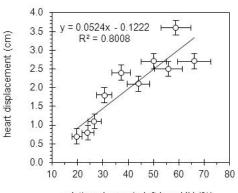

The nanoparticle toxicity was measurable but small and was concentration dependent. The response to kV radiation produced a greater decrease in survival than MV radiation. The 5-FU response was determined and 50% survival was approximately 1 μ g/mL. These results lay the groundwork for synergistic effects. In vivo studies will confirm the translation of our findings.

SP015.3 - Change in Hounsfield Units due to lung expansion as a predictor of LAD and heart displacement in patients undergoing deep inspiration breath hold for left sided breast cancer Author(s): Peta Lonski¹, David Jolly¹, Boon Chua², Damien Philips³, Maria Portillo³, Steven David², Amanda Philips³, Tomas Kron¹ ¹Physical Sciences, Peter MacCallum Cancer Center, Melbourne/ AUSTRALIA, ²Department Of Radiation Oncology, Peter MacCallum Cancer Center, Melbourne/AUSTRALIA, ³Radiation Therapy Services, Peter MacCallum Cancer Center, Melbourne/AUSTRALIA

Aim: Deep inspiration breath hold (DIBH) is a cardiac sparing technique for patients with left sided breast cancer undergoing external beam radiotherapy. Little work has been published on patient-specific quality assurance for DIBH. This study aims to assess the relationship between change in lung Hounsfield Units (HU) that occurs between a free breathing (FB) CT scan and deep inspiration breath hold (DIBH) scan and the displacement of the heart and left anterior descending (LAD) coronary artery from the radiation target volume.

Methods: Ten consecutive left sided breast cancer patients underwent a FB and a DIBH CT scan. A single clinician contoured the heart and LAD for all patients. The mean lung HU were sampled over a 2 cm (length) area spanning across the lung on the coronal plane above the diaphragm. For assessment of heart and LAD displacement, a line was drawn on the axial slice using the CT software between the medial and left lateral ball bearings to define a region of interest (reference line), which typically would correspond to a high dose region. The distance of the anterior aspect of the LAD, as well as the amount of heart present from this line was measured on both scans.

Results: The heart and LAD displacement measured from the reference line as a function of the relative change in HU is shown in Figure 1 and 2, respectively. Displacement was found to increase with relative change in HU for the left lung. There was no significant correlation with the right lung.

relative change in left lung HU (%)

Figure 1 – heart displacement as a function of the relative change in left lung HU

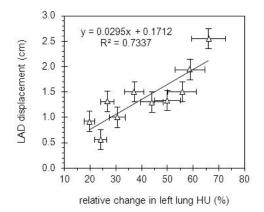

Figure 2 – LAD displacement as a function of the relative change in left lung HU

Conclusion: This study demonstrates that changes in HU of the left lung, which is a surrogate for lung expansion, could potentially be used to predict the heart and LAD displacement achieved in DIBH. Further studies would be required to validate these findings. This may have future implications for patient-specific quality assurance for DIBH.

SP015.4 - Samarium-153 Labelled Microparticles for Targeted Radionuclide Therapy of Liver Tumor

Author(s): Nurul A.A. Hashikin¹, <u>Chai Hong Yeong</u>¹, Basri Johan Jeet Abdullah¹, Kwan Hoong Ng¹, Lip Yong Chung², Rehir Dahalan³, Alan C. Perkins⁴

¹Department Of Biomedical Imaging, Faculty Of Medicine, University of Malaya, Kuala Lumpur/MALAYSIA, ²Department Of Pharmacy, Faculty Of Medicine, University of Malaya, Kuala Lumpur/MALAY-SIA, ³Medical Technology Division, Malaysian Nuclear Agency, Bangi/MALAYSIA, ⁴Radiological And Imaging Sciences, University of Nottingham, Nottingham/UNITED KINGDOM

Introduction — Samarium-153 (¹⁵³Sm) is widely used in radiation synovectomy and pain management for patients with bone metastases due to its beta emissions. ¹⁵³Sm also emits gamma radiation of 103 keV which is suitable for imaging, as shown in previous studies. This provides a beneficial alternative for therapy with pure beta emitter, for example in liver radioembolization using Yttrium-90 (⁹⁰Y). This study aimed to explore the theranostics properties of ¹⁵³Sm in targeted radionuclide therapy of unresectable liver cancer. *Materials & Methods*— The cation-exchange resin, Amberlite IR-120 H⁺ (Sigma Aldrich, USA) which is commercially available in large beads (620-830 µm), was crushed and sieved into size of 20–40 µm and labelled with 1 g of¹⁵²SmCl3 salt prior to neutron activation. Therapeutic activity of 3 GBq ¹⁵³Sm was aimed based on the standard activity used by the ⁹⁰Y SIR-Spheres. The samples were irradiated in 1.494 x 10¹² n.cm⁻².s⁻¹ neutron flux for 6 h. Characterization of the microparticles, gamma spectroscopy, and in-vitro radiolabelling studies were carried out and compared to a commercially available resin readily made in 20–40 µm, Fractogel EMD SO3⁻ (S) (Merck, Germany).

Results- Fourier Transform Infrared (FTIR) spectroscopy of Sm-Amberlite microparticles showed unaffected functional groups within the resin, following size reduction of the beads. However, the microparticles were irregular in shape as shown by the electron microscope. The radioactivity achieved after 6 h of neutron activation was 3.104 ± 0.029 GBg. The specific activity per microparticle for ¹⁵³Sm-Amberlite and ¹⁵³Sm-Fractogel were 55 Bq and 49 Bq, respectively. Gamma spectroscopy data showed that no radioactive impurities were detected in ¹⁵³Sm-Amberlite samples but there was a detectable amount of ²⁴Na in the ¹⁵³Sm-Fractogel samples. Furthermore, Energy Dispersive X-ray (EDX) spectroscopy of Sm-Fractogel showed presence of chlorine impurity but no significant impurities were observed in ¹⁵³Sm-Amberlite samples. Radiolabeling efficiency of ¹⁵³Sm-Amberlite tested in distilled water and blood plasma were excellent (99.9 and 96.9%, respectively) whilst ¹⁵³Sm-Fractogel showed lower labelling efficiency (92.3 and 92.9%, respectively) over a test period of 48 h.

Discussion— Despite the irregular shape due to mechanical grinding of the resin, ¹⁵³Sm-Amberlite formulation showed excellent radiolabelling efficiency and no impurities were detected during the labeling and neutron activation processes. In comparison, the presence of chlorine and ²⁴Na in Sm-Fractogel formulation as well as its lower radiolabelling efficiency make it less suitable to be used for radioembolization of the liver tumour.

Conclusion— ¹⁵³Sm-Amberlite microparticles presented suitable characteristics for liver radioembolization as an alternative to ⁹⁰Y. It has advantage over the ⁹⁰Y for being able to do post-procedure imaging to estimate treatment efficacy. Dosimetric study needs to be carried out to estimate radiation dose contributed by the gamma radiations from the ¹⁵³Sm. Further animal studies are also needed to verify its in-vivo distribution, and biochemical stability.

SP015.5 - Anatomical Modelling of the Pregnant Radiotherapy Patient

Author(s): <u>Tanya Kairn</u>¹, Scott Crowe², Joanne Mitchell¹, David Schlect³, Jamie Trapp⁴

¹Physics, Genesis CancerCare Queensland, Auchenflower/AUSTRA-LIA, ²Radiation Oncology, Royal Brisbane and Women's Hospital, Herston/QLD/AUSTRALIA, ³Radiation Oncology, Genesis Cancer-Care Queensland, Auchenflower/AUSTRALIA, ⁴Science And Engineering Faculty, Queensland University of Technology, Brisbane/ AUSTRALIA

In any case where the use of external beam radiotherapy (EBRT) to treat a pregnant patient is unavoidable, it is important that the radiation dose to the developing fetus is evaluated as accurately as possible. Fetal dose estimates are needed when making treatment planning decisions, when designing personalized radiation shielding and when providing the pregnant patient with an appropriate risk assessment.

Sophisticated models for calculating dose throughout the body have been used for radiation protection and nuclear medicine since the 1960s, however due to the easy availability of patient CT data, the easy availability of patient CT data makes the development of similar models for EBRT treatment dose calculations obsolete, in most clinical situations. For pregnant patients however, the abdominal anatomy is routinely excluded or shielded, during the acquisition of the treatment planning CT, and therefore cannot be included in outof-field dose calculations.

This study therefore aimed to take existing anatomical models of pregnant women, currently used for radiation protection and nuclear medicine dose calculations, and adapt them for use in the calculation of fetal dose from external beam radiotherapy (EBRT).

The models investigated were 'KATJA', which was provided as an MCNPX geometry file, and 'RPI-P6', which was provided in a simple, voxelized binary format. In-house code was developed, to convert both models into an 'egsphant' format, suitable for use with the BEAMnrc and DOSXYZnrc Monte Carlo codes. The geometries and densities of the resulting phantoms were evaluated and found to accurately represent the source data.

As an example of the use of the phantoms, the delivery of a cranial EBRT treatment was simulated using the BEAMnrc and DOSXYZnrc Monte Carlo codes and the likely out-of-field doses to the fetus in each model was calculated. All sources of out-of-field dose (radiation leakage from the linac head, scatter of the primary beam from the linac head and the intervening air, and scatter of the primary beam within the patient) were included in the simulation.

The results of these calculations showed good agreement (within one standard deviation) between the doses calculated in KATJA and PRI-P6, despite substantial anatomical differences between the two models. For a 36 Gy prescription dose to a 233.2 cm³ target in the right brain, the mean doses calculated in a region of interest covering the entire uterus were 1.0 +/- 0.6 mSv for KATJA and 1.3 +/- 0.9 mSv for RPI-P6.

This work is expected to lead to more comprehensive studies of EBRT treatment plan design and its effects on fetal dose in the future. The novel codes developed for this study may also be used to produce EBRT Monte Carlo simulation files from other radiation safety models, including pediatric patients of various ages.

SP016.1 - 18F-NaF PET/CT-directed dose escalation in stereotactic body radiotherapy for spine oligometastases from prostate cancer

Author(s): Lili Wu¹, Sandi A. Kwee², Mei Li¹, Xun Peng¹, Liangxi Xie¹, Zhixiong Lin¹, Hui Wang³, Yu Kuang³

¹Radiation Oncology, Cancer Hospital of Shantou University Medical College, Shantou/CHINA, ²John A. Burns School Of Medicine, University of Hawaii, Honolulu/HI/UNITED STATES OF AMERICA, ³Department Of Medical Physics, University of Nevada Las Vegas, Las Vegas/NV/UNITED STATES OF AMERICA

Purpose: To investigate the technical feasibility of SBRT dose painting using ¹⁸F-NaF positron emission tomography (PET) scans guidance in patients with spine oligometastases from prostate cancer. Materials/Methods: Six patients with 15 spine oligometastatic lesions from prostate cancer who had ¹⁸F-fluorine PET/CT scan prior to treatment were retrospectively included. GTVreg was delineated according to the regular tumor boundary shown on PET and/or CT images; and GTVMATV was contoured based on a net metabolically active tumor volume (MATV) defined by 60% of the SUVmax values on 18F-NaF PET images. The PTVs (PTVreg and PTVMATV) were defined as respective GTVs (plus involved entire vertebral body for PTVreg) with a 3-mm isotropic expansion margin. Three 1-fraction SBRT plans using VMAT technique along with 10 MV flattened filter free (FFF) beams (Plan24Gy, Plan24-27Gy, and Plan24-30Gy) were generated for each patient. All plans included a dose of 24 Gy prescribed to PTVreg. The Plan24-27Gy and Plan24-30Gy also included a simultaneous boost dose of 27 Gy or 30 Gy prescribed to the PTVMATV, respectively. The feasibility of ¹⁸F-NaF PET-guided SBRT dose escalation was evaluated by its ability to achieve 100% of the prescription dose to cover at least 90% of the PTV volume while adhering to organs-at-risk (OARs) dose constraints.

Results: In all 33 SBRT plans generated, the planning objectives and dose constraints were met without exception. Plan24-27Gy and Plan24-30Gy had a significantly higher dose in PTVMATV than Plan24Gy (p < 0.05), respectively, while maintaining a similar OARs[>] sparing profile.

Conclusion: Using VMAT with FFF beams to incorporate a simultaneous ¹⁸F-NaF PET-guided radiation boost dose up to 30 Gy into a SBRT plan is technically feasible without violating normal tissue tolerances. The relationship between local control and normal tissue toxicity during ¹⁸F-NaF PET-guided dose escalation in SBRT should be validated in clinical trials.

SP016.2 - Evaluation of a lung tumor autocontouring algorithm for intrafractional tumor tracking using 0.5T linac-MR: phantom and in-vivo study

Author(s): Jihyun Yun, Eugene Yip, Zsolt Gabos, Keith Wachowicz, Satyapal Rathee, B Gino Fallone

Medical Physics, Cross Cancer Institute, Edmonton/CANADA

We developed an autocontouring algorithm for intrafractional lungtumor tracking using linac-MR, and evaluate its performance with phantom and *in-vivo* MR images.

A pulse-coupled neural network is the main component of the algorithm responsible for tumor contrast improvement from its surrounding anatomy (normal lung, blood vessels). Prior to treatment, an expert user needs to contour the tumor and its maximum anticipated range of motion in pretreatment MR images. During treatment, however, the algorithm processes each intrafractional MR image and automatically generates a tumor contour without further user input. The algorithm is designed to produce a tumor contour that is the most similar to the expert's one.

To evaluate the algorithm in our linac-MR environment (0.5T MRI), a motion phantom and four lung cancer patients were imaged with 3T MRI at ~4 frames per second, and the images were degraded to reflect the image quality characteristic of lung tumor MR images at 0.5T. During scanning (~3 minutes), the phantom was driven according to four different 1-D motion patterns (sine pattern with 4 cm amplitude, 4 seconds period + three lung tumor motion patterns), and the patients were in free breathing. Each of these pseudo-0.5T images was autocontoured using our algorithm. In each test image, the Dice's coefficient (DCE) and Hausdorff distance (HD) between the expert's manual contour (ROIstd) and the algorithm generated contour (ROIauto) were calculated to measure their similarity, and their centroid position difference ($\Delta dcentroid$) was calculated.

Our algorithm successfully contoured the shape of a moving tumor from pseudo-0.5T MR images. Example images are shown in Fig. 1, and the autocontouring accuracy is summarized in Table 1. From the *in-vivo* study, we achieved 87–92 % of contouring agreement and centroid tracking accuracy of 1.03–1.35 mm. These results demonstrate the feasibility of lung tumor autocontouring in our laboratory's linac-MR environment.

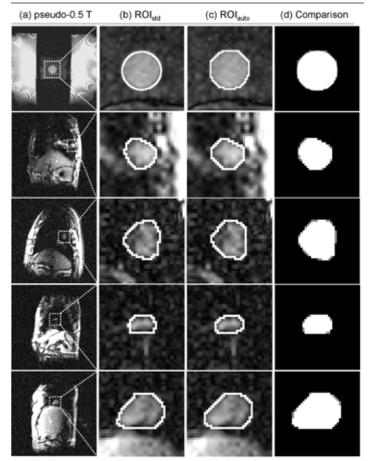

FIG.1. Example images of the phantom (top row) and four patients (bottom three rows). Column (a): pseudo-0.5T images. Column (b) and (c): ROI_{atd} and ROI_{auto}. Column (d): comparison between ROI_{atd} and ROI_{auto} (overlapping region is shown in white pixels, whereas any deviation is indicated by gray pixels). Each example image (from top to bottom) showed DCE of 0.97, 0.95, 0.97, and 0.98, respectively.

Table 1. Summary of contour shape fidelity and centroid position accuracy							
Mean(SD)		DCE		HD (mm)		$\Delta d_{centroid}$ (mm)

SP016.3 - Multi-modal image registration for MR-guided radiotherapy workflow based on detection of features in a customized stereotactic body frame

Author(s): <u>Paul Mercea</u>¹, Asja Pfaffenberger¹, Markus Stoll¹, Gernot Echner¹, Armin Runz¹, Regula Gnirs², Florian Sterzing³, Tilmann Bostel³, Rolf Bendl⁴

¹Division Of Medical Physics In Radiation Oncology, German Cancer Research Center (DKFZ), Heidelberg/GERMANY, ²Division Of Radiology, German Cancer Research Center (DKFZ), Heidelberg/ GERMANY, ³Department Of Radiation Oncology, University Hospital Heidelberg, Heidelberg/GERMANY, ⁴Faculty Of Medical Informatics, Heilbronn University, Heilbronn/GERMANY

Introduction

Shuttle-based MR-guided radiation therapy with separate MR imaging and treatment devices requires both reproducible patient immobilization and robust multi-modal image registration. In the MR-guidance study [1] currently conducted at our institution a customized stereotactic body frame (CSBF) was developed to facilitate image registration. The aim of this work is to develop an algorithm for fast detection of features in the CSBF in order to support image registration for assessment of patient setup alteration.

Methods

The CSBF is equipped with a long (600mm) and a short (80mm) hose (inner diameter 2mm) filled with contrast agent. The former is bent in its middle at an angle of 28.07° surrounding the latter which is centered horizontally (see Fig.1). Image data of one patient from the MR-guidance study cohort has been selected for evaluation. Besides the treatment planning CT, Cone-Beam CTs (CBCTs) and their corresponding T2 weighted MR images (MRIs) from 16 fractions were used. To identify lines representing the hoses in the images, a probabilistic Hough transform on thresholded gradient image slices is performed in posterior-anterior direction. Detected line pairs oriented towards each other most akin to a notional isosceles triangle formed by a straight line representing the short hose and two lines representing the tapering ends of the long hose are further analyzed. The image data is traversed along the triangle's edges in search of local intensity maximums. Principle component analysis of the detected maximum intensity distribution enables refinement of the detected lines. Eventually, line intersections are re-calculated and used for landmark-based rigid registration.

Results

Evaluation of the algorithm was performed by registration of the detected points from each MRI and CBCT with interactively placed reference points in the planning CT. For the 16 MRIs the mean root mean square registration error (RMSRE) was 0.78mm and for the 16 CBCTs 0.97mm. Additionally, each MRI was matched to its corresponding fraction CBCT resulting in a mean RMSRE of 0.65mm. Registration results were also assessed qualitatively by visual Inspection (see Fig.1).

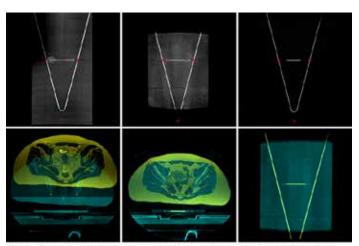

Fig. 1: Top row: Contrast agent filled hoses with detected features (red crosses) in CT (left), CBCT (middle) and T2 weighted MRI (right). Bottom row: Unregistered fusion of fraction CBCT (eyan) and MRI (yellow) (left); Registration result in transversal view (middle) and in coronal view (right), hoses in CBCT and MRI are accurately aligned in both orientations.

Conclusions

An algorithm for multi-modal detection of characteristic features in a CSBF was developed. Accurate results and robust performance on 32 image data sets were achieved. The benefits from incorporating this algorithm, as a preprocessing step, for patient position correction will be evaluated in future research.

Image guided radiotherapy (IGRT) is gaining popularity in radiation oncology. Among different IGRT imaging modalities, ultrasound (US) is portable, affordable, and non-ionizing. To monitor the abdominal organ motion during IGRT, we previously developed a probe holder to reproduce the simulation probe position during treatment. However, the metallic parts inside the probe caused artifacts in the CT images (see Fig. 1). This work quantifies the influenceof metal artifacts on the treatment plan.

A CIRS Triple Modality 3D Abdominal Phantom (model 057A) including kidneys, lung, and liver, with six tumors inside the liver was scanned using Phillips Brilliance Big Bore CT both with and without the probe in place. A passive arm was used to hold the probe with minimum pressure applied to avoid any phantom deformation. The CT scan without the probe was used for treatment planning in Pinnacle 9.8. Six tumors with distance 60~127 mm to the probe and organs at risk were contoured. Individual plan was made for each tumor. All tumors were prescribed to receive 4000 cGy dose in five fractions. Two VMAT partial arcs avoiding the US probe were adopted based on the fused CT image. After treatment planning on the CT without US probe, the beams for each tumor were copied to corresponding plan for dose calculation in CT scan with probe and associated metal artifact. The dose difference between two plans due to voxel density variation from CT artifacts was evaluated.

Minimal dose discrepancy was observed between two plans created with and without the probe in place, as shown in Table 1. All six tumors had less than 0.8% mean dose difference due to metal artifact. These results indicate the probe artifacts have minimal impact on treatment planning dose calculation, particularly when the tumor is relatively distant to the probe.

Table 1: The PTV volume, tumor distance to probe, mean PTV dose and PTV dose difference between two plans for six tumors in the liver.						
	tumor1	tumor2	tumor3	tumor4	tumor5	tumor6
PTV volume [cm3]	7.26	2.97	7.84	3.11	2.48	2.30
Tumor distance to probe [mm]	87.2	87.9	61.0	60.4	145.2	127.8
mean PTV dose to plan with probe [cGy]	4126	4182	4134	4093	4153	4240
mean PTV dose to plan with- out probe [cGy]	4142	4151	4121	4088	4157	4245
mean PTV dose differ- ence [%]	0.39	-0.73	-0.31	-0.10	0.08	0.11

SP016.5 - Software development for image guidance on the magnetic resonance-guided radiation therapy (MRgRTTM) system

Author(s): <u>Wenyao Xia</u>¹, Stephen L. Breen², An Wang², David Jaffray²

¹Radiation Physics, Princess Margaret Hospital, Toronto/CANA-DA, ²Radiation Medicine, Princess Margaret Hospital, Toronto/ON/ CANADA

Background: The magnetic resonance-guided radiation therapy (MRgRT[™]) system utilizes a moveable MRI system to provide image-guidance in a linear accelerator (Linac) vault. By exploiting the superior soft tissue contrast available with MR-guidance, our goal is to provide more accurate patient positioning based on internal soft tissue. To implement cone beam CT (CBCT) and MR guidance effectively, we developed a novel software tool using the 3D Slicer platform.

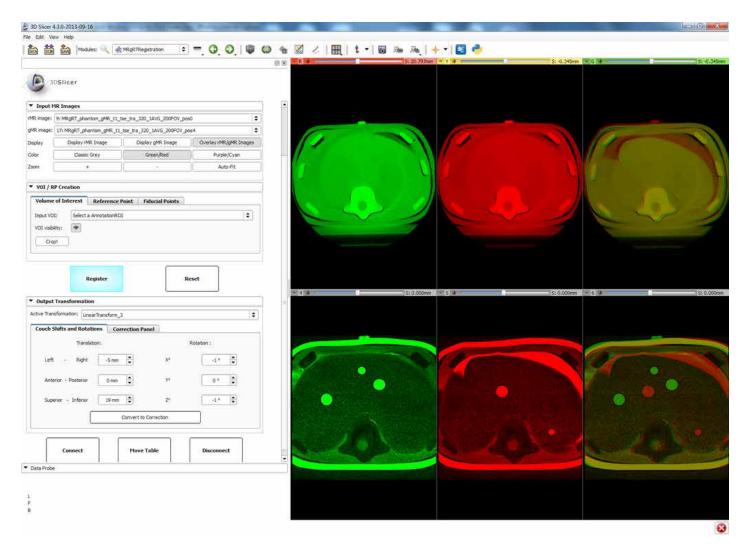

Objectives: This software tool was built to handle reference CT (rCT) and MR (rMR) images from treatment simulation as well as guidance CBCT and MR (gMR) images from daily image guidance. Key design goals include: (i) support various data formats such as DICOM CT, DICOM MR, DICOM spatial registration objects; (ii) provide communication and data flow between different imaging, treatment and storage devices; (iii) perform accurate and robust image registration; (iv) provide a user-friendly graphical interface for users to manipulate data and assess registration quality; and, (v) output couch coordinate shift information to correct patient position for treatment.

Methods: We designed the software to import reference CT and MR images as well as guidance CBCT and MR images from the Mosaic Data Director (MDD), accurately register the guidance MR image to the reference MR, and export couch correction information to the Varian external interface to drive the couch to the correct position. Furthermore, we have developed storage capability to save all patient data, images, and registrations as a DICOM secondary capture, which allows us to re-examine the case and study the MR-guidance performance over time.

Results: All image data from the simulated workflow were successfully loaded into our software tool. Registration of the reference MR to the guidance MR was successful with resulting mean squared errors (MSE) for the four phantom shifts of 0.23 mm, 0.40 mm, 0.11 mm, and 0.10 mm. Registration of the corresponding CT images was also successful with resulting MSE of 0.35mm, 0.21 mm, 0.33mm, and 0.26mm. Couch corrections were generated based on the registration information and exported. Finally, each test case was saved as a DICOM file and stored within the database.

Conclusions: In this study, we demonstrated the successful implementation of a comprehensive image-guidance tool for the MRgRT system in the 3D Slicer platform. We plan to use this tool to study the MRgRT system's performance in guiding patient positioning based on soft tissue contrast and develop novel applications to enhance the clinical value of MR-guidance in radiation therapy.

SP016.6 - Ultrasound guided radiotherapy with rotational correction for patient setup: a feasibility study

Author(s): <u>Sook Kien Ng</u>¹, Lin Su¹, Yin Zhang¹, Iulian Iordachita², John Wong¹, H T. Sen³, Peter Kazanzides³, Muyinatu A. Lediju Bell³, Kai Ding¹

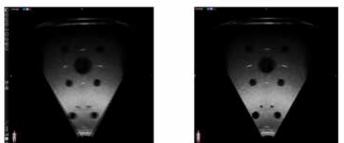

¹Department Of Radiation Oncology, Johns Hopkins Univesity, Baltimore/MD/UNITED STATES OF AMERICA, ²Department Of Mechanical Engineering, Johns Hopkins University, baltimore/MD/UNITED STATES OF AMERICA, ³Department Of Computer Science, Johns Hopkins University, baltimore/MD/UNITED STATES OF AMERICA

Ultrasound guided radiotherapy is a promising IGRT modality due to its features of no-ionizing and high soft tissue contrast. The Clarity ultrasound system (Elekta, Stockholm, Sweden) has been successfully used in our clinic for real time intra-fraction motion monitoring in prostate SBRT. However, current Clarity system does not have feedback to treatment machine with patient rotational correction. This study aims to investigate the feasibility of applying Clarity system for ultrasound guided patient setup with rotational correction.

In this study, we used a six-degree-freedom robotic patient positioning system, HexaPOD (Elekta, Stockholm, Sweden). Both HexaPOD and Clarity utilize infrared markers and camera for room coordinate positioning. To integrate both systems, the Clarity infrared camera was installed in parallel with HexaPOD camera. A prostate phantom and an ultrasound calibration phantom were secured and aligned to the isocenter. US probe abutting the phantom was fixed via the transperineal ultrasound base plate (Figure 1). A 3D image of the phantom was captured first as patient simulation day ultrasound. Three different rotation levels were used in this study. For the first rotation, we rotated the couch by 1 degree on roll, pitch and yaw. For the second and third levels, 2 and 2.5 degrees were applied. After each rotation, an ultrasound image was acquired as patient treatment day ultrasound. Four ultrasound scans were acquired for each phantom and exported to Velocity (Varian, Palo Alto, CA) for manual image registration analysis (Figure 2).

Minimal rotational discrepancy was found between the actual rotation applied by HexaPod and the analysis from Velocity. The average rotation difference is 0.034 degree for the prostate phantom and 0.026 degree for the calibration phantom. These results show ultrasound images acquired by Clarity system are able to recover rotation correction which can be potentially be sent back to HexaPOD for clinical patient rotation correction.

SP017 - Calculational Techniques in Therapy Dosimetry

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP017.1 - Dosimetric Effect of Beam Angle on the Unflattened and Flattened Photon Beams: A Monte Carlo study Author(s): James Chow¹, A Owrangi²

¹Princess Margaret Cancer Center, Toronto/CANADA, ²University of Michigan Health System, Ann Arbor/UNITED STATES OF AMERICA

This study compared the variations of depth and surface dose on beam angle between the unflattened and flattened photon beams. Monte Carlo simulation based on the EGSnrc code was used in dose calculation. Phase-space files of the 6 MV photon beams (field size = 10 X 10 cm²) were generated with and without the flattening filter based on a Varian TrueBeam linear accelerator. Depth and surface doses were calculated in a water phantom with angles of the photon beams turning from 0° to 15°, 30°, 45°, 60°, 75° and 90°. Our results showed that compared to the flattened photon beam, the unflattened beam had a higher dose in the build-up region but lower dose beyond the depth of maximum dose. With the Monte Carlo beams cross-calibrated to the machine monitor unit in simulations, dose ratios of the unflattened to flattened beams were in the range of 1.6 - 2.6 as shown in Figure 1 with beam angles varying from 0° to 90° in water. In addition, higher surface doses of about 2.5 times were found (Figure 2) with beam angles equal to 0° and 15°. However, surface dose deviation between the unflattened and flattened beam became smaller with an increase of beam angle. Using the photon fluence incorporated to the monitor unit, variations of depth and surface dose on the beam angle were investigated and compared. For the unflattened and flattened photon beams, the surface dose and range of depth dose ratios (unflattened to flattened beam) decreased with an increase of beam angle.

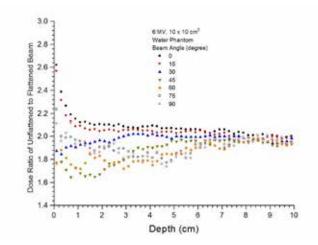

Fig. 1: Relationship between the dose ratio (unflattened to flattened photon beams) and depth.

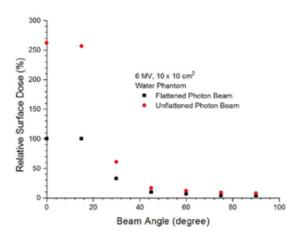

Fig. 2: Relationship between the relative surface dose and beam angle for the 6 MV unflattened and flattened photon beams.

SP017.2 - Monte Carlo calculations and measurements of the TG-43U1 recommended dosimetric parameters for the 125I (Model IR-Seed2) brachytherapy source

Author(s): <u>Hassan Ali Nedaie</u>¹, Sahar Sheikholeslami², Mohsen Hasani², Ali S. Meigooni³

¹Radiotherapy Oncology Department, Cancer Research Centre, Cancer Institute, Tehran University of Medical Sciences, Tehran/ IRAN, ²Azad University, Department of Engineering, Science and Research Branch, Islamic Azad University, Tehran/IRAN, ³Comprehensive Cancer Centers of Nevada, Las Vegas/UNITED STATES OF AMERICA

Abstract

Purpose: Recently a new design of the ¹²⁵I (Model IR-seed2) brachytherapy source has been manufactured for prostate seed implant. Figure 1 show a schematic diagram of this source.The goal of this project is to evaluate the dosimetric characteristics of this source model using experimental and Monte Carlo simulation methods following the recommendation of Task Group 43 of the American Medical Physicist in Medicine (AAPM).

Methods: Dosimetric characteristics of IR-seed2 were determined by using experimental and Monte Carlo simulation methods according to the recommendation by Task Group 43(TG-43U1). The simulations were performed using MCNP5 in water and Plexiglas, and measurements were performed using TLD-GR207A chips dosimeters in Plexiglas Phantom. The Plexiglas data is used for verification of the accuracy of the source and phantom geometry used in the Monte Carlo simulations. The final MC simulated data in water would be recommended for the clinical applications. The experimental setup for measurement of radial dose function and anisotropy function is shown in Fig. 2 and 3.

FIG. 1. Schematic diagram of the ¹²⁵I (Model IR-seed2) brachytherapy source

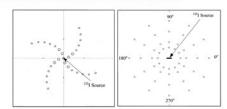

FIG.2. Schematic diagram of the experimental setup for measurement of radial dose function (Left) and 2D anisotropy function (right).

Results: The Monte Carlo calculated dose rate constant Λ of the ¹²⁵I in water was found to be 0.992 0.025 cGyU⁻¹h⁻¹. Radial dose functions of the new source model based on point and line source approximations were calculated at distance ranging from 0.1 to 7 cm. Moreover, *gL*(*r*) was measured in Plexiglas phantom material using TLD chips. In addition, the 2D anisotropy function, *F*(*r*, θ), were calculated and measured in both Plexiglas and water phantom.

Conclusions: The results of these investigations show an agreement of about $\pm 7\%$ between the measured and simulated data in Plexiglas. The statistical uncertainty of MC within $\pm 5\%$ relative to the previously published data for different brachytherapy sources.

Based on the results, the Monte Carlo simulated dosimetric parameters of the new ¹²⁵I source in water are recommended for their clinical applications.

SP017.3 - Assessment of RayStation treatment planning algorithm to calculate dose in the presence of lung tissue

Author(s): <u>Manuel Rodriguez</u>, Mohammad Rezaee, Steve Bartolac, Jean-Pierre Bissonnette

Department Of Radiation Oncology, University of Toronto, Toronto/ CANADA

Purpose: To investigate the accuracy of RayStation treatment planning algorithm to calculate absorbed dose when the photon beam is disturbed by attenuation or lateral scatter of lung material.

Materials:

A farmer type ion chamber was placed in the center of 30x30x20 cm³ water phantom with a 5 cm lung material slab at 3 cm form the chamber when the beam was perpendicular to the lung slab and at 1 cm from the chamber when the beam was parallel to the lung slab. A SSD=100cm PDD curve was also measured placing a Gafchromic EBT2 film in the interface of the solidWater-lungSlab with the lung slab parallel to the beam and starting at 10 cm depth. Measurements were taken for 6 and 18 MV photon beams and for 10x10, 5x5 and 3x3 cm² field sizes. The ratio of the dose with and without the lung slab is reported.

Results:

The ratio of the measured dose with and without the lung slab (Dlung/Dsw) is within 1% of that ratio calculated by RayStation algorithm for all energies and field sized used when the beams are parallel and perpendicular to the lung slab (table 1). The PDD curves measured with gafchromic film with and without the presence of lung slab agree with those calculated by RayStation algorithm within the uncertainty of the measurements (figure 1), which is within 3%.

Conclusion:

Raystation dose calculation algorithm takes into account inhomogeneity corrections. It models attenuation of the beam and lateral scatter within 1% of points measured with ion chambers. PDD curves in the presence of lung material also agree with gafchromic film measurements within the uncertainty of the measurements. Therefore, RayStation has an acceptable algorithm to correct dose from photon beams perturbed by lung tissue.

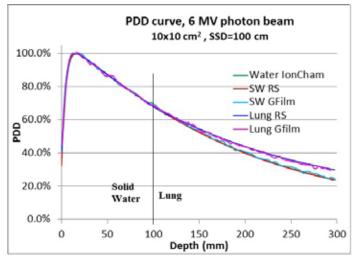

Figure 1.

Table 1. Ratio of the measured dose in solid water with and with- out the lung slab related to the same ratio calculated by RaySta- tion treatment planning algorithm.					
	Lung slab			Lung slab

SP017.4 - Improving the efficiency of charged particle transport in magnetic fields in EGSnrc

Author(s): Victor Malkov, David W.O. Rogers

Department Of Physics, Carleton University, Ottawa/CANADA

Image Guided Radiation Therapy (IGRT) technologies aim to improve the accuracy of the delivery of radiation with the hopes of decreasing damage to healthy tissues and sensitive organs. Synergetic MRI-Radiation therapy machines are a developing technology that can provide improved tumour tracking during treatment to help accommodate for patient motion or unaccounted for bodily changes over the full course of treatment. Porting the advantages of MRI technology into IGRT comes with the cost of introducing a magnetic field around the patient while a radiation beam is present. This

magnetic field (MF) causes curvature in the charged particle trajectory, and can lead to significant variations in dose distributions, particularly at tissue-air interfaces, and lead to changes in the dose response of detectors. Our aim is to evaluate our implementation of the influence of the MF in the EGSnrc Monte Carlo code system, and deliver a detailed study of the increased computational requirements of our code. Monte Carlo (MC) codes have become a staple in radiation treatment planning systems, and are extensively used in radiation dosimetry and Medical Physics research. The EGSnrc code, a popular general purpose MC package used in Medical Physics, previously supported charged particle transport in magnetic fields, but in the transition from EGS4 this feature of the code went untested. Our implementation is based a framework similar to the one originally proposed by Bielajew, but we have introduced a higher order integration algorithm for the condensed history mode and made use of the single scatter algorithm in the EGSnrc code. To properly handle region transitions, additional changes were made related to the boundary crossing algorithm. These alterations lead to a reduction in the total required computational time compared to the previous implementation since larger step sizes can be taken during the simulation. These improvements prove crucial since the original theory required strict step size reduction which can lead to two to 30 fold increases in computation time as compared with the 25% to 50% increases with the current algorithm. The presented results will highlight ion chamber calculations as a function of magnetic field strength and step size constraints to demonstrate the importance of proper selection of system parameters to obtain accurate solutions. These results will be of particular benefit for groups looking to make use of the EGSnrc code or another MC package for calculating dose distributions in the presence of magnetic field. The improved computational efficiency of the presented code reduces the need for large computational facilities, making it a valuable research tool for investigating the effects of magnetic fields on radiotherapy treatments.

SP017.5 - Accurate Monte Carlo dose calculations for permanent implant prostate brachytherapy: first results from a large scale retrospective study

Author(s): <u>Nelson Miksys</u>¹, Eric Vigneault², Luc Beaulieu³, Rowan Thomson¹

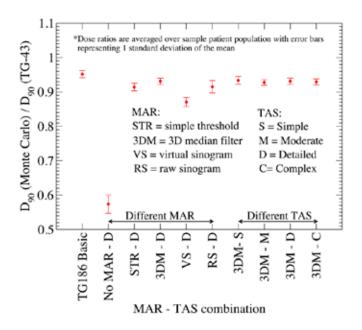

¹Department Of Physics, Carleton University, Ottawa/CANA-DA, ²Université Laval Cancer Research Centre, Quebec City/ CANADA, ³Department De Physique Et Centre De Recherche En Cancerologie, Universite Laval, Quebec City/CANADA

Recently, the joint AAPM-ESTRO-ABG-ABS TG-186 report endorsed Monte Carlo (MC) dose calculations for brachytherapy as they are more accurate than the traditional TG-43 water-based paradigm. MC dose calculations require accurate patient-specific computational models often derived from post-implant CT images. We have explored issues related to the accurate modelling of the patient geometry by investigating algorithms to mitigate seed artifacts in addition to comparing detailed schemes for mapping image CT numbers to tissue type and mass density in the MC models. Here, we present our advanced MC patient-specific modelling approaches and initial dosimetric results of the first large retrospective MC dose calculation study (of approximately 1000 patients).

The EGSnrc user-code BrachyDose is employed for MC dose calculations of clinical prostate brachytherapy. Seed artifacts are mitigated by applying a metallic artifact reduction (MAR) algorithm to post-implant CT images. Artifact-mitigated images are used to derive MC phantoms by applying one of several tissue assignment schemes (TAS) mapping voxel CT number to tissue composition and mass density. MC-calculated dose distributions and clinical dose metrics for the target and OARs (organs-at-risk) are compared to each other (between different MAR and TAS models) and to TG-43 water-based calculations.

In the target, D90 calculated following the TG-43 approach is about 5% higher than the basic TG-186 MC approach which assigns average soft tissue compositions and uniform mass densities, and up to 15% higher than more accurate MC models that realistically account for calcifications and tissue heterogeneities. Failing to mitigate artifacts and then employing a TAS which assigns calcification results in inaccurate models with seeds encased in calcification and a D90 which is over 40% lower than TG-43 and over 30% lower than more accurate MC models. The application of different MAR methods can change the D90 by over 5%, but typically by only a few percent. Changes in the TAS, including the modelling of calcifications and organ at risk tissues, changes the D90 by a few percent with larger differences in highly calcified patients. OAR doses can vary by tens of percent depending on the assigned tissue compositions.

This work has employed state-of-the-art patient-specific MC models yielding dose calculations that are more accurate than TG-43 and basic TG-186 recommendations. This large-scale retrospective study will enable investigation of correlation between dose and treatment outcome, in addition to assessment of potential changes to prescription dose with the adoption of advanced model-based dose calculations for brachytherapy.

SP017.6 - Analytic modelling of in-field and out-of-field bremsstrahlung contamination dose in high energy electron beams used in external radiotherapy

Author(s): <u>Mohamad Mohamad Alabdoaburas</u>¹, Dimitri Lefkopoulos², Jean Pierre Mège², Jean Chavaudra², Atilla Veres³, Florent De Vathaire², Ibrahima Diallo²

¹University of Paris-Sud(11), Orsay/FRANCE, ²Madical Physics, Gustave Roussy, Villejuif Cedex/FRANCE, ³Equal-Estro laboratory, Villejuif Cedex/FRANCE

Introduction

Bremsstrahlung dose component becomes important when scattering dual-foils and scrapers applicators are used, as compared to scanned electron beams and cone applicators. Several studies have been reported on bremsstrahlung dose component inside the irradiation field. The aim of this study is to develop an analytical model for the assessment of the bremsstrahlung dose distribution at any point in the patient in-field and out-of-field.

Materials and methods

The bremsstrahlung dose component in electron beams arises from four main sources considered in our model: scattering dual-foils, collimator jaws, applicator's scrapers and insert of cerrobend. We have neglected the bremsstrahlung generated in the patient. Our model consists in two main parts: in the first part, we calculate the angular energetic fluence distribution for every bremsstrahlung photon source, using an existing model based on a multi-scattering theorem. In the second part, we calculate the relative number of pixels irradiated by the primary electron beam in every bremsstrahlung photon source. All programmings were executed by Matlab. All detailed information about the geometry, material composition, and size of each component have been provided by the manufacturers. Most of the data on the electrons interactions with matter are based on ICRU-1984 data. Measurements of bremsstrahlung dose component were achieved with TLD-700 powder thermoluminescent dosimeters, from 0 cm to 70 cm from the beam central axis, at a depth of 10 cm in a water phantom for a Varian 2300C/D Linac, operated at 6,9,12 and 18MeV.

Results

We demonstrate that out-of-field bremsstrahlung dose is essentially produced by applicator's scrapers, while the out-of-field bremsstrahlung dose generated in scattering dual-foils can be neglected. In-field bremsstrahlung dose comes essentially from scattering dual-foils, which represents 70%-80% of total in-field bremsstrahlung dose. Our modelling results show a very good agreement between calculated and measured values, in-field and out-of-field. The average difference between calculated and measured values is less than 10%, which represent a very small difference in absolute dose.

Conclusion/perspective

Our approach can be used to provide a good representation of bremsstrahlung dose distributions in all healthy tissues for any applicator size and type and for any electron beam energy used in high-energy electron beam therapy.

SP018 - Small Animal Research Technologies

TRACK 06: NEW TECHNOLOGIES IN CANCER RESEARCH AND TREATMENT

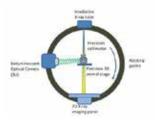

SP018.1 - New Technologies in Cancer Research and Treatment Author(s): <u>Frank Verhaegen</u>¹, Stefan Van Hoof¹, Patrick V. Granton², Sanaz Yahyanejad³, Marc Vooijs³, Chris Vanhove⁴, Ludwig Dubois³ ¹Radiotherapy Physics, Maastro Clinic, Maastricht/NETHER-LANDS, ²Physics, London Regional Cancer Program, London/ON/ CANADA, ³Maastro Lab, University Maastricht, Maastricht/NETH-ERLANDS, ⁴Medisip, University Ghent, Ghent/BELGIUM

The current state-of-the-art in radiotherapy (RT) is precision fractionated irradiation of tumors, with intended sparing of the surrounding normal tissue. To achieve this, highly accurate methods to aim radiation beams with complex static or dynamic shapes have been developed. In addition, various forms of anatomical and functional imaging (e.g., CT, PET, MR) have been integrated with the irradiation technology to achieve accurate targeting and dose verification. This integration was achieved using complex treatment planning software. These innovations are largely responsible for improved cancer treatment outcomes in recent years, rather than an improved fundamental insight in radiation response of normal and cancer tissues.

To gain more fundamental insight, and also to allow investigating the combination of radiation and other cancer agents, recently much progress was made towards developing advanced small animal combined irradiation/imaging platforms. The recent availability of small animal image-guided precision radiotherapy devices (Fig 1) in a growing number of centers is currently revolutionizing preclinical research. Researchers now can perform SmART (Small Animal RadioTherapy) research with devices that combine precise irradiation with highresolution imaging in one system; the concept of image guided RT (IGRT). The essential components of a SmART research platform are: precision animal positioning, precision irradiation with small photon beams, onboard CT imaging and onboard bioluminescent imaging, all in the same coordinate system. In addition, an accurate treatment planning software for small animals, SmART-Plan, was developed at our institute. We recently added inverse planning capabilities to SmART-Plan to improve workflow and standardization of preclinical studies.

Several preclinical trials have been initiated at our institute. As an example, we used precision image-guided irradiation of the upper right lung lobes of 76 C57BL/6 adult male mice, with doses of 0-20 Gy. We used image registration and image analysis in this longitudinal study to establish a dose response for radiation-induced lung fibrosis. It was found that the mice were more resistant for high doses of radiation when small beams are used (in the literature, often large field irradiation preclinical studies are reported). This is one of the first studies where accurate irradiation and image analysis are used on such a scale. Many other experiments are being performed or planned now.

The final aim is to identify those combined novel treatments that have the best chance of success for clinical translation. In this work, we will report on the progress of the research in this new field at our institute.

Schematic overview of Sm&RT research platform. At the center of the system the specimen is located on a precision stage. The farge ring can notate around the specimen and holds a precision irradiator, an x-ray irraging parel to accipire a CT scan, and a bioluminescence camera to collect emitted photons from internal markers for biological processes.

SP018.2 - Longitudinal MRI evaluation of whole brain radiotherapy on brain metastasis development and dormancy in a mouse model

Author(s): <u>Donna H. Murrell</u>, Niloufar Zarghami, Michael D. Jensen, Ann F. Chambers, Eugene Wong, Paula J. Foster Medical Biophysics, Western University, London/ON/CANADA

A major challenge in breast cancer treatment is its ability to metastasize – commonly to liver, lung, bone, and brain – thereby complicating detection and therapy. When cancer cells arrive at distant sites, they may experience different fates: (1) death, (2) proliferation creating metastases, or (3) dormancy (remaining viable but nonproliferative).

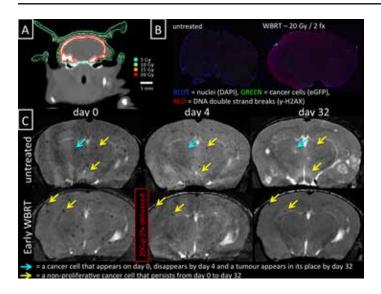

This work uses high-resolution anatomical and iron-labelled cellular MRI techniques developed in the Foster lab (Heyn *et al.*, Magn Reson Med, 2006) to monitor cancer cell fate in the brain during metastasis progression. We combine this with image-guided microirradiation techniques developed in the Wong lab (Jensen *et al.*, Med Phys, 2013) to investigate the growth of brain metastatic breast cancer and concurrent responses of metastases and dormant cancer cells to whole brain radiotherapy (WBRT).

The micro-CT/RT system was commissioned for mouse WBRT (20 Gy/2fx) using a collimated field of 10x14 mm and a parallel-opposed beam set-up. A Monte Carlo dose verification calculation was performed to confirm this plan [A]. Tumour morphology and proliferation were assessed by *ex vivo* tissue staining (H&E, Ki67). γ -H2AX staining for DNA double strand breaks confirmed biological damage to the whole brain post-irradiation [B].

Two animal experiments were performed (n=24): (1)'Late' WBRT delivered when MRI-detectable tumours had developed; this is similar to the case of clinical diagnosis, or (2)'Early' WBRT given following initial cancer cell arrest in the brain, prior to tumour growth.

'Late' WBRT was able to halt tumour growth. At 11 days post-therapy, the average volume of a treated tumour was significantly smaller than untreated (p<0.01); however, the number of MRI-detectable tumours did not decrease and some tumours continued to grow.

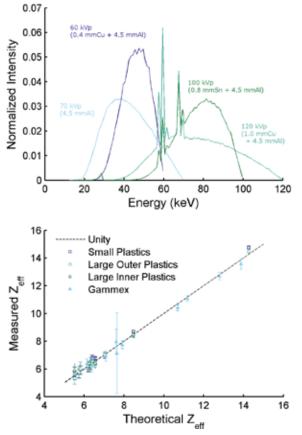

'Early' WBRT was more effective than 'late' and was able to eradicate nearly all tumours [C]. The number of metastases and total tumour volume in treated brains were significantly less than untreated (p<0.05). There was a reduction in the number of MRI signal voids (from solitary iron-labeled cancer cells) over time; however, there was no significant difference between groups at any time point. Signal voids from non-viable cells are cleared from the brain; therefore, residual signal voids observed here are potentially viable dormant cells. This suggests dormant cancer cells can persist and are potentially viable, even if WBRT is delivered very early and has eliminated the tumour burden. Further investigation of the dormant cell population is warranted as these may respond to future proliferation signals and contribute to cancer recurrence.

SP018.3 - Dual energy micro-CT determination of effective atomic number and electron density

Author(s): <u>Michael D. Jensen</u>¹, Jeff Z. Chen², Eugene Wong¹ ¹Medical Biophysics, Western University, London/CANADA, ²London Regional Cancer Program, London Health Science Center, London/CANADA

Dual energy micro-CT could improve dose calculation accuracy in small animal image guided radiotherapy by providing the effective atomic number (Zeff) and electron density of tissue. A new CMOS detector with improved detective quantum efficiency has enabled us to narrow the spectrum of the dual energy scans and reduce polyenergic artefacts in the source images. This allowed us to replace the previous pairing of 70 kVp (4.5 mmAl) and 120 kVp (1.0 mmCu + 4.5 mmAl) by 60 kVp (0.4 mmCu + 4.5 mmAl) and 100 kVp (0.8 mmSn + 4.5 mmAl). We scanned four custom-made micro-CT phantoms of two sizes (three 2.54 cm, one 6.08 cm in diameter) constructed of 11 plastic materials. Twelve electron density inserts from a clinical phantom were also scanned. A previously published image space spectral algorithm for determining Zeff and relative electron density was applied to the micro-CT images. Previous results with the old detector and energy spectrums (70 kVp, 120 kVp) showed beam-hardening artefacts, with the mean percent difference between Zeff theory and measurement of 3.2% for the small phantoms, and 7.8% for the large phantom. With the new detector and aggressively filtered energy spectra (60 kVp, 100 kVp), the mean percent difference between Zeff theory and measurement was 2.2% for the small phantoms and 2.0% for the large phantom. For the clinical electron density inserts, the mean percent difference between theory and measurement improved from 6.0% to 2.9% for Zeff, and 4.5% to 2.8% for relative electron density. The improved performance of the new detector comes at the cost of increased acquisition time, as multiple low dose frame averages are need to reduce photon statistics noise. In conclusion, a new CMOS detector has allowed micro-CT imaging with narrower energy spectra and improved determination of the effective atomic number and relative electron density.

SP018.4 - Tissue characterization using dual energy cone beam CT imaging with a dedicated small animal radiotherapy platform

Author(s): <u>Patrick V. Granton</u>¹, Guillaume Landry², Mathieu Gaudreault³, Frank Verhaegen⁴

¹Physics, London Regional Cancer Program, London/ON/CANA-DA, ²Department Of Medical Physics, Ludwig-Maximilians-University, Munich/GERMANY, ³Département De Radio-oncologie, CSSS de Chicoutimi, Chicoutimi/CANADA, ⁴Radiotherapy, Maastro Clinic, Maastricht/NETHERLANDS

Purpose

There is a growing number of preclinical image-guided high-precision conformal irradiation devices tailored to small animal geometries. Typically, 225kVp is used as the treatment photon energy. A potential error in the dose prescription lies in the dose calculation phase where there is uncertainty in the tissue composition. Dualenergy CT (DECT) provides estimates of the effective atomic number Zeff and the relative electron density *re* when two CT images are acquired at different energies. As Zeff describes tissue composition; DECT of small animals could yield 1) information on the adequacy of approximating mouse tissues by tabulated human compositions and 2) improved tissue assignment for Monte Carlo-based dose calculation algorithms. The goal of this work was to optimize the selection of kVp-pairs, and investigate a recent DECT algorithm for robustness, accuracy, and precision using a dedicated small animal irradiation platform.

Materials

Two mouse-sized phantoms, one acting as DECT calibration and the other as DECT validation, were custom-made from inserts of the

Gammex (RMI467) and CIRS (062MQA) electron density calibration phantoms, respectively. The phantoms were imaged using a preclinical irradiator (XRAD225Cx, PXI) for a series of kVp settings (40-100) in increments of 10 kV. The exposures were adjusted to yield air kerma equivalent imaging dose of 30 cGy for each kVp. Images were decomposed into Zeff and *r*e for each kVp pair and compared against referenced values. The best energy pair was chosen on the basis of accuracy and noise for both Zeff and *re*. The experimental DECT imaging was compared against simulations using a CT software package (ImaSim) with different amounts of image noise. DECT imaging of a dead mouse, plasticized mouse, and a human heart was performed and assessed.

Results

The 40-80 kVp pair was identified as the optimal DECT protocol, yielding a mean errors of $0.9 \pm 2.6\%$ on Zeffand $0.8 \pm 1.8\%$ on re; simulation results were similar.

Conclusion

We have implemented DECT for an optimal small animal imaging protocol, enabling tissue characterization for dose calculation of preclinical radiotherapy studies. Using known tissue-like materials for the DECT calibration are important aspects in achieving accurate DECT imaging.

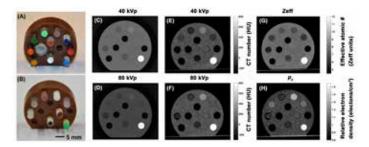

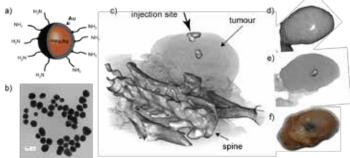

Figure 1 (A,B) Photos of the calibration and validation phantom; (C,D,E,F) Simulated and experimental images of the validation phantom; (G,H) *Z*eff and *r*e images of the calibration phantom. The average noise within the CT images was 15HU.

SP018.5 - Low-dose prostate cancer brachytherapy by injections of radioactive gold nanoparticles (103Pd:Pd@Au NPs) Author(s): Myriam Laprise-Pelletier, Diane Djoumessi, Jean Lagueux, Marie-France Côté, Marc-André Fortin Axe Médecine Régénératice, Centre de recherche du centre Hospitalier Universitaire de Québec, Québec/CANADA

Here we report on the development of a new approach for low-dose prostate cancer brachytherapy, based on the injection of radioactive 103Pd:Pd@Au NPs. Photons emitted by the radioisotope palladium (103Pd; photon energy : 20.1 and 23.0 keV), interacting with gold distributed in the vicinity of and inside cells, are expected to lead to higher energy deposition compared with conventional low-dose brachytherapy. A rapid (~4h), one-pot procedure was developed to synthesize ultra-small ¹⁰³Pd:Pd nanoparticles (radioactive precursor: ¹⁰³PdCl2, MDS Nordion, Canada), followed by encapsulation with gold (Figure 1a-b; nanoparticle diam .: ~ 40 nm). Thus-obtained core-shell nanoparticles were stabilised with biocompatible polyethylene glycol (NH2-PEG-SH), purified and concentrated by centrifugation. The tumour retention of ¹⁰³Pd:Pd@Au-PEG NPs was studied in a PC3 prostate cancer xenograft model (n = 11). For this, the NPs were labeled with a moderate (sub-therapeutic) labeling activity level (4 µCi 103Pd/mmol Au; 2 µL/ injection). The animals were CT-scanned immediately after implantation, then at time-points (1 and 8 days). The ¹⁰³Pd:Pd@Au NPs injection sites were clearly

identified and delineated on CT data obtained from each one of the implanted tumours. Volume reconstruction was performed on each injection site (Figure 1c-e), in order to quantify Au NP diffusion. At t = 2h (n = 3), 1 day (n = 4) and 8 days (n = 8), the tumours were harvested and radioactivity-counted. An organ biodistribution study was also performed (liver, spleen, kidneys, lungs). In 8/11 animals, the total activity retention in the tumours was higher than 80% of the total activity in the animal (93.2% \pm 7.7%). After 8 days, the % of total activity retained in the tumours, was (92.0% \pm 12.1%). Liver activities higher than 20% of the total animal activity were found in 3 animals, indicating that, in some injection and tumour conditions (e.g. vascularization of the tumour, interstitial fluid pressure), a fraction of Au NPs is taken up by the vasculature and immune cell processes, ending up in the organs associated to the reticuloendothelial system (liver, spleen). In resume, ¹⁰³Pd:Pd@Au-PEG NPs were efficiently synthesized (rapidity, reaction yield, colloidal stability, NPs concentration, purification), injected in prostate cancer tumours, and efficiently visualised in CT. In the perspective of clinical applications, the liver and spleen Au NP uptake must be adequately controlled by using either a polymeric or a molecular cancer cell targeting strategy to secure the retention of NPs in tumours.

SP019 - Nanobiosensors and Nanotheranostics

TRACK 08: BIOSENSOR, NANOTECHNOLOGY, BIOMEMS AND BIOPHOTONICS

SP019.1 - Synthesis and evaluation of C595 mAb-conjugated SPIONs nanoprob for specific detection of Prostate cancer Author(s): Mohammad Abdolahi¹, Sophie Laurent², Lionel Larbanoix², Corine Sermeus², Sebastien Boutry³, Robert N Muller² ¹Persian Gulf Nuclear Medicine Research Center, Bushehr University of Medical Sciences, Bushehr/IRAN, ²General, Organic And Biomedical Chemistry, University of Mons, Mons/BELGIUM, ³Center for Microscopy and Molecular Imaging, Charleori/BELGIUM

Introduction: Carcinoma of the prostate is the most frequent diagnosed malignant tumor in men and is the second leading cause of cancer-related death in this group. Despite the efficacy of local therapy (surgery or radiation therapy) for treating localized disease, the cure rate is highly dependent on the stage of disease at the diagnosis and early detection of prostate cancer is key to designing effective treatment strategies. However, In its early stages, PC rarely causes symptoms and the majority of men diagnosed with advanced PC at the time of diagnosis. New detection methods are needed for prostate cancer, particularly for metastatic disease, in order to provide patients the best possible staging and treatment. The objective of the present study is to locate primary tumors or distant metastases using MRI with contrast agents targeted specifically to cancer cells. We take advantage of the fact that many types of prostate cancer cells express high levels of mucin 1 (MUC1) oncoprotein on their cell surface. The imaging strategy is to use superparamagnetic iron oxide nanoparticles (SPIONs), attached to an antibody that directly target MUC1, to specifically enhance the contrast of MUC1-expressing prostate cancer cells. The use of antibody-conjugated MRI contrast agents to specifically target cancer cells has been demonstrated previously for some other cancers. Here, we demonstrate an MRI contrast agent targeted specifically to the MUC1-expressing prostate cancer cells.

Methods: A number of cell lines were chosen for MRI experiments: DU-145 cells, which express a high level of MUC1, and LNCaP cells, which do not express MUC1. Conjugation of Mab C595 (anti MUC1) to commercial SPIONs (Micromod, 20 nm diameter) was achieved by using a heterobifunctional linker, sulfo-SMCC . LNCaP and DU-145 cells incubated with conjugated SPIONs. In vitro and in vivo imaging was performed in a 7 T MRI system .

Conclusions: Results of this study showed that through functionalization of SPIONs by C595 monoclonal antibody specific binding of the SPIONs to the MUC1-expressing cells is achievable. With development of this and similar imaging specific vehicles, more effective and detailed diagnosis of prostate cancer through high concentrations of SPIONs at the tumors site is possible.

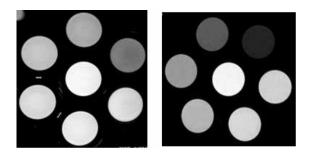

Fig1. T2-weighted imaging of LNCaP cells (3×10^6) after 2h incubation with SPIO-C595 nanoprobe (Left) and DU145 (Right) at Fe concentration of 0, 5, 10, 20, 40, 80 µg/ml (The vial in the middle is PBS alone without any contrast agent).

SP019.2 - Magnetic Resonance Nanotheranostics of Guerin's Carcinoma

Author(s): <u>Valerii E. Orel</u>¹, Thanos Mitrelias², Marina Tselepi², Eugeniy Kruchkov¹, Alexander Rykhalskiy¹, Andriy Romanov¹, Tatyana Golovko¹, Crispin H.W. Barnes², Igor Shchepotin¹ ¹Medical Physics & Bioengineering Research Laboratory, National Cancer Institute, Kyiv/UKRAINE, ²Cavendish Laboratory, University of Cambridge, Cambridge/UNITED KINGDOM

We proposed a new technology of nanotheranostics that is combination of magnetic resonance therapy and chemotherapy during moderate hyperthermia below 40 °C inside tumor with diagnostics by magnetic resonance imaging. As nanotheranostics agent the multifunctional magnetosensitive nanocomplex consisted of nanoparticles containing Fe3O4 with diameters < 50 nm and antitumor drug doxorubicin was used. The synthesis of multifunctional magneto-sensitive nanocomplex was performed in a magnetomechanical reactor. We conducted a detailed imaging study of transplanted Guerin's carcinoma in rats during treatment with magnetic nanotherapy. We showed that treatment with magnetomechano-chemically synthesized magnetosensitive nanocomplexes based on Fe3O4 nanoparticles conjugated with the antitumor agent doxorubicin and followed by irradiation with local electromagnetic irradiation resulted in a better outcome than treatment with conventional doxorubicin or treatment with magnetic nanocomplexes without electromagnetic irradiation. An analysis of magnetic resonance images obtained over time showed that the application of local electromagnetic irradiation did not alter the position of magnetic nanocomplexes in the tumor.

SP019.3 - Effects of Fluorescence Gold Nanoclusters on Anti-oxidation and Anti-aging by Cell Model

Author(s): <u>Walter H. Chang</u>¹, Wen Hsiung Chan², Nai Ruei Cyue¹, Cheng-An J. Lin¹

¹Department Of Biomedical Engineering, Chung Yuan Christian University, Taoyuan/TAIWAN, ²Department Of Biotechnology, Chung Yuan Christian University, Taoyuan/TAIWAN

We have developed gold nanoclusters (Au@DHLA, Diameter = 2nm) with red - NIR fluorescence and excellent biocompatibility as novel bioprobes. Moreover, we further found that Au@DHLA is not only a promising probe for cell labeling but also has the anti-oxidative stress properties and further improved cell viability. These novel findings indicate that Au@DHLA has a potential to reduce senescence and apoptosis. We observed the interaction of Au@DHLA with mouse osteoblasts, fibroblasts, and hepatocytes. Au@DHLA has been found to have rapid and efficient cell uptake into the mouse cells, although the toxicity analysis of mouse osteoblasts, fibroblasts and hepatocytes of the tolerance variation are not the same, but it is confirmed that Au@DHLA for mice cells has a good biocompatibility. In the experiment, we utilized the hydrogen peroxide that induced the increase of the oxidative stress of the mice cells then stained it with the dye (DCF-DA) and flow cytometry is used to observe Au@DHLA. We found the results of the intracellular oxidative stress in mice were reduced and the collagen detected in fibroblasts production in the known Au@DHLA does not affect the production. In detecting the ability of Au@DHLA of calcification experiments, we found that the low concentrations of Au@DHLA do not affect the ability of osteoblast calcification. We also found hepatocytes can generate the cholesterol, however Au@DHLA does not affect the hepatocytes. These study results demonstrated that

Au@DHLA has high potential to be developed as nanomaterials with anti-oxidation, anti-apoptosis and anti-aging properties for the application in medical research, aesthetic medicine, and regeneration medicine.

SP019.4 - Nanoparticle-aided Radiotherapy for Retinoblastoma and Choroidal Melanoma

Author(s): Yucel Altundal¹, Erno Sajo¹, G. M. Makrigiorgos², Ross Berbeco², <u>Wilfred Ngwa²</u>

¹Physics & Applied Physics, University of Massachusetts Lowell, Lowell/UNITED STATES OF AMERICA, ²Radiation Oncology, DFCI/BWH/Harvard Medical School, Boston/UNITED STATES OF AMERICA

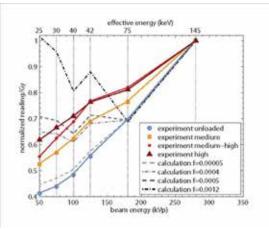

This work investigates the dosimetric feasibility of employing gold nanoparticles (AuNPs) or carboplatin nanoparticles (CNPs) to enhance radiotherapy (RT) treatment efficacy for ocular cancers: retinoblastoma (Rb) and choroidal melanoma (CM), during kVenergy internal and external beam radiotherapy. The results predict that substantial dose enhancement may be achieved by employing AuNPs or CNPs in conjunction with radiotherapy for ocular cancer using kV-energy photon beams. Brachytherapy sources yield higher dose enhancement than the external beam in kV energy range. However, the external beam has the advantage of being non-invasive.

SP019.5 - Nanoparticle enhancement of radiation dose: experimental confirmation using scintillation dosimetry Author(s): David R. Mckenzie¹, Marie Christine Zdora¹, Paul Z.Y.

Liu², <u>Natalka Suchowerska²</u> ¹School Of Physics, University of Sydney, Sydney/AUSTRALIA, ²Radiation Oncology, Chris O'Brien Lifehouse, Sydney/AUSTRALIA

Nanoparticles of high atomic number enhance the radiation dose delivered and therefore are potentially useful in radiation therapy. The effects of beam energy and nanoparticle size on dose enhancement has been modelled using Monte Carlo and the response of cells has been measured *in-vitro*. However, for different cell-lines a range of responses has been observed, which are not always consistent with the Monte Carlo predictions. The aim of this study is to provide a direct measurement of the dose enhancement that is independent of the cytotoxicity of the particles or the manner in which cells take up the particles.

A composite was made using commercially available liquid scintillator (BC430 or BC 498) and gold nanoparticles (diameter 30nm, Nanopartz Inc). The scintillation light emitted during irradiation was used to evaluate the enhanced dose from the photoelectrons emitted from the nanoparticles. The samples were exposed to radiation beams with a range of energies (50kV, 75kV, 100kV, 125 kV, 180kV and 280kV). Some of the emitted light was absorbed by the nanoparticles and this effect was corrected for. The scintillation light was coupled into a PMMA fibreoptic and transferred to a photo multiplier tube (PMT) for readout. The PMT was calibrated to dose after subtracting the background signal consisting of Cerenkov, fluorescent and stray light. A theory was developed using photon absorption cross sections taken from the NIST XCOM database (Berger et al 1998).

The Figure shows the response of the organic liquid scintillator BC-498 per Gy of delivered dose normalized to 280 kVp for different volume fractions of gold nanoparticles. Theoretical curves (dashed) are the predicted enhancement for different volume fractions of gold nanoparticles and are based on monoenergetic effective energies. The experimental data was obtained with polyenergetic beams. It was found that the scintillator response became less energy dependent for higher nanoparticle loading. However the trend in preferential dose enhancement at lower energies, as predicted by theory, was not well reproduced by experiment. This result suggests that the assumption in the theory, that all photoelectrons are released from the nanoparticles into the surrounding medium is not valid.

We have made a direct measurement of the dose enhancement caused by the presence of gold nanoparticles in a medium under irradiation. The dose was found to be enhanced preferentially at lower photon energies, but not to the extent predicted by a simple theory. This conclusion is independent of the properties of living cells.

SP019.6 - Graphene Plasmonics as Promising Platform for Highly Sensitive Plasmonic Sensing

Author(s): Dong Ha Kim

Chemistry And Nano Science, Ewha Womans University, Seoul/ KOREA

Surface plasmon resonance (SPR) is the collectively oscillating charge densities at the interface between thin metal film and dielectrics in resonance with the incident light. SPR-based sensors have emerged as a versatile tool for the label-free and real-time biomolecule sensing during the recent two decades. However, it has been recognized that the sensitivity has yet to be improved to allow for single molecule detection. Incorporation of additional plasmonic nanostructures onto SPR sensor chip is one of the most promising strategies. The use of graphene in conventional plasmonic devices was suggested by several theoretic research studies. Plasmons in graphene were also intensively investigated by some researchers and tight confinement, tunability and long propagation which make graphene as a promising material for SPP-based optical nanodevice applications were reported. It is required to enhance the light-matter interaction for the actual applications despite of relatively high light absorption of single layer graphene. In this regard, the use of graphene in conventional plasmonic devices has been suggested. However, the existing theoretic studies are not consistent with one another and the experimental studies are still at the initial stage. To reveal the role of graphenes on the plasmonic sensors, we deposited graphene oxide (GO) and reduced graphene oxide (rGO) thin films on Au films by layer-by-layer self-assembly method and their refractive index (RI) sensitivity was compared for the first time in SPR-based sensors. The deposition of GO bilayers with number of deposition L from 1 to 5 was carried out by alternative dipping

of Au substrate in positively- and negatively charged GO solutions. The fabrication of layer-by-layer self-assembly of the graphene films was monitored in terms of the SPR angle shift. GO-deposited Au film was treated with hydrazine to reduce the GO. For the rGO-Au sample, 1 bilayer sample showed a higher RI sensitivity than bare Au film, whereas increasing the rGO film from 2 to 5 layers reduced the RI sensitivity. In the case of GO-deposited Au film, the 3 bilayer sample showed the highest sensitivity. The biomolecular sensing was also performed for the graphene multilayer systems using BSA and anti-BSA antibody.

SP020 - Biomedical Modeling

TRACK 09: BIOSIGNAL PROCESSING

SP020.1 - Respiratory parameters have different patterns in imposed-inspiration and imposed-expiration within a closed pneumatic circuit in rats

Author(s): <u>Fabio G. Aoki</u>¹, Marcelo H. Valenga¹, Thiago G. Rodrigues¹, Paulo F.G. Cardoso², Rogerio Pazetti², Henrique T. Moriya¹ ¹Escola Politecnica, University of Sao Paulo, Sao Paulo/BRAZIL, ²Instituto Do Coracao, University of Sao Paulo, Sao Paulo/BRAZIL

Computer-controlled research ventilators for small animals (SAV) are often used to assess the respiratory mechanics' parameters such as resistance and elastance of the respiratory system in animal models of disease. In commercially available SAVs, it is common to obtain such parameters with the forced oscillation of a given volume of air into respiratory system with a quasi-sinusoidal pattern in a closed pneumatic circuit (i.e. both the injection and the removal of gas during the piston movement). We hypothesized that obtaining the respiratory mechanical parameters with the linear single-compartment model (LSCM) during the forced inspiration and forced expiration (when calculated together) is not sufficient to explain the physiology of the respiratory system exposed to high doses of bronchial agonist. In order to verify this, male Wistar rats (n = 5) were anesthetized, orotracheally intubated, mechanically ventilated at 90bpm (or 1.5Hz) with a tidal volume of 10mL/kg, and a positive end-expiratory pressure (PEEP) was set at 3cmH2O. The ventilation was performed in a commercial mechanical ventilator (flexiVent, SCIREQ Inc., Canada) and the animals were infused with a saline solution (PBS), followed by 3 increasing doses (3, 30 and 300mg/mL) of the bronchial agonist methacholine (MCh). Respiratory parameters were calculated by the LSCM. Pressure and volume data, calibrated and corrected by a proprietary software, were analyzed using a computational routine. The full quasi-sinusoidal signal data was compared to inlet and outlet of air from the lungs separately. The data obtained showed that the difference among the three signals (i.e. whole signal, imposed-inspiration, and imposed-expiration) is pronounced at the higher dose (MCh 300mg/mL). Data from imposed-inspiration alone seem to better reflect the respiratory mechanics when a large dose of bronchial agonist is used.

SP020.2 - Autonomic and cardiovascular responses to food ingestion and gum chewing in healthy young subjects Author(s): Kyuichi Niizeki, Tadashi Saitoh

Biosystems Engineering, Yamagata University, Yonezawa/JAPAN

Objective: Our previous study has demonstrated that in humans mental stress exerts an influence on the oscillations of respiratory sinus arrhythmia (RSA), inducing incoherent phase lag with respect to breathing in addition to a decrease in the amplitude of RSA¹). It was suggested the enhanced sympathetic nerve activity during stress may modulate the transduction property of cardiac vagal efferent nerve. However, whether coherent oscillations of RSA could be altered by other physiological condition has not been shown. We hypothesized that dietary behavior may induce strong cardiorespiratory synchronization, because that the digestive organs are innervated by parasympathetic nervous system. In this study, we examined cardiovascular responses to eating solid food and chewing a tasteless gum, with special reference to whether the phase coherency of RSA is altered by dietary behavior.

Methods: After 5 min of rest, 14 subjects were asked to eat solid meal [maple flavored Calorie Mate (CM)] at their own pace, which

was followed by 5 min postprandial recording. We also examined the separate effects of mastication on cardiovascular variables by chewing a tasteless gum (GM). We measured ECG by means of wireless electrocardiogram, beat-by-beat blood pressure (BP) by means of Finapres, and breathing activity by inductance plethysmography. The R to R interval (RRI) of ECG wave and respiratory movement signals were sampled with a frequency of 10 Hz. These signals were further band-pass filtered with the frequency range 0.1~0.5 Hz. Instantaneous phases and amplitudes of RSA and respiration were continuously calculated by Hilbert transform, and then phase coherence (λ) between RSA and respiration was computed. Beat-to-beat stroke volume (SV) was determined by the pulse-contour method. Cardiac output (CO) was SV times heart rate (HR) and total peripheral resistance (TPR) was mean BP divided by CO. To assess autonomic activation, the low- and high-frequency components of heart rate variability (HRV) were computed by applying a fast Fourier transform by the Welch method.

Results and Discussion: From rest to CM, transient increase in BP and decrease in RRI were observed. A transient decrease in λ was also observed during CM. At the termination of eating, BP, RRI, and λ gradually returned to the level of resting condition. These responses were slightly blunted in GM. On average, a significant decrease in λ was observed during CM and GM. This was accompanied by increases in BP and CO as well as decrease in RRI under no compensatory reduction in TPR. In contrast to our hypothesis, these cardiovascular responses suggest a shift of sympathovagal balance toward a sympathetic activation. However, HRV indexes did not show any significant changes in response to CM and GM. The λ was positively correlated with normalized amplitude of RSA (P<0.01). We suggest that phase coherence analysis of RSA could provide a sensitive measure for evaluating cardiac autonomic influences on dietary behavior compared to the conventional frequency analysis of HRV.

SP020.3 - Characteristic Analysis and Modeling for Signals of Auditory Propagation Pathway

Author(s): Qin Gong¹, Xiaolin Li¹, Tao Zhang², Xi Chen¹ ¹Biomedical Engineering, School of Medicine, Tsinghua University, Beijing/CHINA, ²Tsinghua National Laboratory for Information Science and Technology (TNList), Beijing/CHINA

Otoacoustic Emissions (OAE) and Auditory Brainstem Response (ABR) play important roles in the processing information of the auditory perception. Most previous studies only measured one signal simultaneously. When comparing the features between the signals, the testing conditions might be changed, lacking of proofs to ensure the integrity and coherence. Based on the integrated detection system of auditory propagation pathway, the OAEs and ABRs were measured simultaneously in normal subjects under different intensity and frequency of click and tone burst stimulation. The model to simulate the TEOAEs latency-frequency function was built up, and the latencies between OAEs and ABRs were further compared. SP020.4 - Numerical Optimization Performance of a Perfusion Kinetic Modelling Algorithm using Volumetric DCE CT Author(s): Igor Svistoun¹, Catherine Coolens² ¹Radiation Physics, Princess Margaret Hospital, Toronto/CANA-DA, ²Dept Radiation Oncology, University of Toronto, Toronto/ON/ CANADA

Introduction: Dynamic-contrast enhanced (DCE) CT imaging is increasingly being used to quantify tissue vascular and functional properties for treatment response assessment by its combination with tracer kinetic modeling. However, clinical kinetic parameter results have been shown to be highly dependent on measurement input and analysis method. Implementing the parameter estimation algorithm involves many design decisions including choice of: data processing sampling rate, continuous-to-discrete system mapping approach and numerical optimization algorithm. As such a simulation framework was designed to investigate the effects of those choices, as well as effects of measured signal aliasing and noise on the accuracy and speed of the parameter estimation.

Methods: A widely-used 2-compartment model (modified Tofts) was chosen which describes the dynamic perfusion properties of a contrast agent using 4 parameters: Ktrans - transfer from blood plasma into extracellular extra-vascular space. Kep - transfer from extracellular extra-vascular space back to blood plasma, Vb - whole blood volume per unit tissue. To account for separation between injection and measurement site, a time delay τ must be added. The 4parameter estimation from the measured data requires numerical optimization. A test framework was developed where an experimentally derived population-average arterial input function and randomly sampled parameter sets {Ktrans , Kep , Vb , T} were used to generate tissue curves. Knowing the ground truth values, 5 numerical optimization algorithms were investigated using multiple starting points from a quazi-random set: sequential quadratic programming (SQP), downhill simplex (Nelder-Mead), pattern search (PS), simulated annealing (SA), and differential evolution (DE). This was repeated for two error function evaluation approaches - finite impulse response (FIR) and infinite impulse response (IIR) approximations of extended Tofts model and the impact of these approaches on speed and accuracy evaluated for sampling rates of 1, 10 and 100 Hz. DE algorithm was implemented in CUDA to run on a GPU for speed improvement testing since processing even a modest area of 128x128x200 voxels would require days on the CPU.

Results: SQP, Nelder-Mead and DE produced good results on clean and noisy input data outperforming SA and PS in terms of speed and accuracy. During calibration, the best 3 algorithms did not exceed absolute error 9.4e-6% for any parameter. When run on typically aliased and noisy (sigma=6HU) data average absolute % errors were: Ktrans=11.96%, Kep=8.2%, Vb=25.7%, τ =3.6%. On average SA and PS took 1 and 2 orders of magnitude, respectively, slower to converge. We found IIR to approximate the model much better at sampling rates 10 times lower than those required for FIR approximation i.e. when up sampling same data and processing with FIR at 10Hz the average absolute error drops from {4.3%, 1.7%, 16.0%, 1.4%} to {4.3%, 1.7%, 6.6%, 0.3%} for each parameter. CUDA_DE runtime averaged at 3e-2 sec/voxel – a speed improvement of 199x over CPU_DE.

Conclusion: Evaluation of different optimization algorithms, sampling and noise scenarios indicated a preferred implementation of CUDA_DE. This will be extended to a clinical version with real-time analysis capabilities with ex-vivo kidney perfusion data presented at the meeting.

SP020.5 - Validation of a Sympathovagal Balance Model to Evaluate Autonomic Function in Rats Using Time-Frequency Analysis

Author(s): <u>Rui Fonseca-Pinto</u>¹, Lucília N. Diogo², Silvia V. Conde², Emilia C. Monteiro², Maria P. Guarino²

¹School Of Technology And Management, Polytechnic Institute of Leiria, Leiria/PORTUGAL, ²Cedoc, Nova Medical School, Faculdade de Ciências Médicas, Lisboa, Portugal, Lisbon/PORTUGAL

The Autonomic Nervous System (ANS) activity can be evaluated in humans by using Heart Rate Variability (HRV) analysis through classical spectral analysis, and more recently by the use of newer techniques by time-frequency analysis. We have previously shown that Blood Pressure (BP) changes felt in HRV spectrum can be assessed and possibly isolated using a hybrid methodology in which HR and BP (in particular diastolic blood pressure) are mixed to produce an instantaneous variation energy plot reflecting the sympathetic and vagal autonomic activity, in other words, the ANS modulation on Heart Rate and Blood Pressure.

In this work we test the same approach in rats with the objective to validate the use of this methodology using continuous Blood Pressure recordings to evaluate the ANS changes.

Data were obtained in 20 rats by using telemetry probes implanted in the abdominal cavity and connected to the abdominal aorta for continuous BP and HR recordings in control situation and also in response to stimuli that change the autonomic response such as chronic intermittent hypoxia and drug administration.

The results showed that this hybrid methodology allows the evaluation of autonomic nervous system balance and can be used in laboratory and eventually in clinical settings to evaluate disautonomies

SP021 - Public Health, Active and Healthy Aging

TRACK 13: INFORMATICS IN HEALTH CARE AND PUBLIC HEALTH

SP021.1 - Informatics in Health Care and Public Health Author(s): Leandro Pecchia

School Of Engneering, University of Warwick, Coventry/UNITED KINGDOM

Learning objectives:

Attenders non experienced in the study of falls will be introduced to the main challenges of this field and will be able to discriminate, interpret and classify interventions for: risk of falling assessment, fall detection, fall prediction and fall prevention

Attenders will learn how physiological monitoring has been used to assess the risk of falling in the next few months

Attenders will learn how physiological monitoring has been used to predict falls due to postural hypotension in the next few minutes

Abstract

Falls are a major problem of later life, causing loss of independence and quality of life for senior citizen and their families. Falls are difficult to prevent, because caused by complex and dynamic interactions between hundreds of intrinsic (subject specific) and extrinsic (circumstance dependent) risk factors.

Multifactorial interventions seem to be most effective approaches to prevent falls, and includes simultaneously exercises, training, multifactorial home assessments, home safety interventions (i.e. elimination of specific risks) and vitamin supplementations. However, inform these interventions with accurate information about the risk of falling in the next few hours, days or weeks is needed in order to make those interventions more cost-effective and sustainable.

Several technologies have been proposed to support or inform these interventions. Many focused on fall detections using wearable sensors (mainly accelerometers and gyroscopes); unobtrusive sensors (i.e. cameras, Kinect, microphones) or ambient sensors (i.e. infrared or pulse-Doppler radar systems to detect motion or to monitor the ambient response to falls as floor vibrations). Fewer studies aimed to detect falls while happening in order to predict the impact (pre-impact fall prediction) and eventually reduce harms (i.e. inflating airbags). Some studies proposed technologies for the risk of falling assessment, using body-worn kinematic sensors or heel and toe clearance measurements.

However, recent studies proved that there are specific circumstances in which the probability of falling is much higher, especially in-door. For instance, the 30% of indoor falls happen while rising from beds or chairs and the risk of falling in specific hours of the day increases significantly.

This talk will present the preliminary result of two studies investigating for the first time how physiological monitoring and biomedical signal processing can support fall prevention intervention by assessing the risk of falling in the middle term (few weeks) and predicting in the short term (few minutes before) falls due to specific circumstances (i.e. rising from bed or chair). Two case studies will be presented in which Heart Rate Variability (HRV) was used to predict falls or to assess the risk of falling, proving that: HRV resulted systematically depressed in fallers;

subjects with a depressed HRV showed a significantly increased relative risk of falling in the next few months;

monitoring the HRV in the 5 minutes before standing-up it is possible to predict postural hypotension, which is the main cause of falls happening while rising.

Finally, the preliminary attempts to integrate those predictive modelling in wearable and unobtrusive monitoring applications for falls prevention will be discussed.

SP021.2 - Monitoring Information System of Aedes Aegypti Reproduction

Author(s): Heleno S. Morais¹, Oziel S. Santos¹, Mateus A. Rocha¹, Tássila Catarina S. Almeida¹, <u>Lourdes M. Brasil</u>², Gerardo A. Idrobo Pizo²

¹College Gamma, University of Brasilia, GAMA/BRAZIL, ²Postgraduate Program In Biomedical Engineering, University of Brasília, Gama/BRAZIL

Aedes aegypti is a mosquito and main transmitter of dengue disease. Dengue is a viral disease that can only be transmitted to Humans by the bite of infected mosquitoes with the virus of the disease. It usually manifests in three clinical types, one of which can lead to death. The classical dengue, is classified as a febrile illness of mild to moderate intensity; dengue hemorrhagic fever, more severe than the last one, it comes to changes in blood clotting of the infected person; and dengue shock syndrome, very rare form, but can be fatal if not treated in time. Furthermore, Aedes aegypti transmits diseases like yellow fever, and it also has fully capacity to transmit chicungunha fever. Due to the fact that it is a fatal disease and the eradication of Aedes Aegypti is practically impossible, it is very important monitoring and control of Aedes Aegypti reproduction. The monitoring and control processes are still precarious when it comes to mosquito eggs counting technology collected through ovitraps vane in breeding sites. Because this processes are performed manually by experts using magnifying glass and tweezers. This paper presents a mechanism to make these processes faster and more efficient, it is a hardware / software interaction mechanism capable of capturing microscopic images of ovitraps vane and from an image processing software automating the counting of eggs contained in the vanes and in the future through geoprocessing inform the locations of higher reproduction of Aedes aegypti in a given region.

SP021.3 - Design and Functionality of a Meta-Reporting Tool within a Medical Devices Vigilance System

Author(s): Antonios Deligiannakis¹, Nikos Giatrakos¹, Aris Dermitzakis²

¹Electronic & Computer Engineering, Technical University of Crete, Chania/GREECE, ²Biomedical Technology Unit, Dept. Of Medical Physics, School of Medicine, University of Patras, Rio, Patra/ GREECE

Medical Devices (MDs) are an important factor related to the quality of healthcare that patients receive. Although regulations have been applied and standards are imposed on MD manufacturing, faulty behavior incidents (referred to as *adverse events*) are frequently observed and reported by various organizations, such as FDA[1] and EUDAMED[2]. Given these reports, which include information about MD products associated with an adverse event, national healthcare authorities have the duty of examining whether listed products match the equipment of administered institutions and of contacting them with information about the potential risks that admitted patients (or users) may encounter. Subsequently, the individual healthcare institutions should cross-check, appropriately maintain, or even withdraw the potentially hazardous MD that they own.

To facilitate healthcare authorities promptly notifying institutions under their organizational chart about potentially hazardous devices, we have designed and developed a meta-reporting, web-based tool as a part of the MEDEVIPAS system. Our tool automatically generates meta-reports of matches of adverse event reports to inventoried MD equipment and to disseminate these meta-reports to institutions in a user-friendly format, conceivable by non-expert (medical or paramedical) users, such as administrative hospital employees. Our tool receives as input information about MD inventories and crawled reports of adverse events. An entity matching algorithm is executed, matching medical devices in reports with those in MD inventories (and computing a matching score in each case) using the manufacturer, model and serial number of a MD, upon the insertion of new reports of adverse events (or of new MDs) in the system. From that point forward, our meta-reporting tool, which is the focus of this paper, provides the necessary functionality to registered users.

Meta-reports are created and made available to registered institutional users via a web application, in a tabular format. The meta-reports display information about potentially affected medical devices of each user, along with data from a related adverse event report, the matching score, etc. This information can also be provided in printable format using the web application. Email alerts are also created and forwarded to their registered accounts automatically upon the detection of a possibly matching device. The alerts are displayed prominently at our web-based tool and remain active until institutional users confirm that they became aware of the cited situations. Our tool also exploits user feedback on the validity of provided meta-reports, which is then incorporated in the entity matching algorithm to increase its accuracy performance (properly modifying the matching score of matched records). Apart from providing meta-reports, analysis capabilities are embodied in our tool in the form of aggregate statistics per MD manufacturer, MD group and registered institution.

SP021.4 - Evaluation of the Impact in the Physical Condition of School Age Children Exposed to an Intervention of Exergaming in Montemorelos Mexico

Author(s): Alejandra Guillen-Peralta, <u>Gerardo S. Romo-Cardenas</u>, Raul Rodriguez-Antonio, Gener Aviles-Rodriguez

School Of Engineering, Montemorelos University, Montemorelos/ MEXICO

The current epidemiological situation of overweight and obesity in Mexico has been extensively documented and analyzed. Studies define the situation as a metabolic and inflammatory disease, of chronic course, multifactorial and with high impact on public health.

For the treatment of this multifactorial phenomenon, strategies have been proposed focused in the promotion and health education of the target audience, seeking at medium- and long term, to prevent and eventually achieve the reduction of this epidemic situation. The school age population is particularly at high risk, with consequences ranging from psychological areas, school performance and organic malfunctioning that could emerge during the lifetime of the individual.

The overweight and obesity appears to be related to environmental factors such as sedentary lifestyle. The improvement of the physical condition through physical activity is a challenge in these new generations.

Considering the sociological features of school age population (6-12 years), their general technological familiarity implied in this age group and their tendency toward virtual interactions, an initiative of using video game platforms was designed performed, in order to promote physical activity (Exergaming). In addition, an evaluation of the impact in the physical condition on the participants through standardized anthropometric and physical performance tests was made, via pre and pos testing. Results shows that there is a significant difference in variables related to flexibility, strength and body composition in a such a way, that opens the possibility to consider this type of virtual tools as an option for physical training in school age children.

SP020.5 - Using the EIP on AHA monitoring tool for the early technology assessment of a planned device to predict in-hospital falls in the elderly

Author(s): <u>Christian E.H. Boehler</u>¹, Fabienne Abadie¹, Lotte Steuten², Leandro Pecchia³

¹Joint Research Centre, European Commission, Seville/ SPAIN, ²Panaxea bv, Enschede/NETHERLANDS, ³School Of Engneering, University of Warwick, Coventry/UNITED KINGDOM

In-hospital falls can lead to severe health consequences for the individual and are associated with substantial cost to health and care systems and it is estimated that up to one third of all in-hospital falls happen straight after standing up from a bed or chair. It is possible that a sudden drop in blood pressure shortly after rising is causative for many of these falls and a recent observational study suggested that the blood pressure after standing up can be predicted with high accuracy based on the ECG registered during the five minutes before rising (82.5% accuracy; false positive 10%; false negative 7.5%). This study aims to inform the design of a device that could warn patients about the immanent risk of falling based on a drop in blood pressure after rising in an early assessment of the health and economic outcomes of such a technology. The monitoring and assessment tool for the European Innovation Partnership on Active and Healthy Ageing will be used in order to predict the potential impact of such a device on the number of falls and subsequent health outcomes as well as the impact on healthcare utilisation. The tool rests on a three-state Markov process (including baseline health status, deteriorated health status (i.e. a fall) and death), which allows estimating the probability of patients having a post-fall event with severe health consequences. Health states will be valued using EQ-5D data from the literature and resource use will be estimated based on the documented consequences of falls in a UK hospital setting. The probability of a fall following a sudden drop of blood pressure and the likelihood to prevent a fall through an alarm triggered by such a drop in blood pressure during standing up will be elicited from a group of falls experts with various backgrounds, including participants of the EIP on AHAs Action Group A2 on falls prevention. Key drivers of health and economic outcomes of the planned intervention will be assessed through extensive sensitivity and scenario analyses. With this study we will not just be able to assess the potential impact of a planned warning device for the prevention of in-hospital falls, but also the value of the EIP on AHA monitoring tool for the early evaluation and the pre-market assessment of new and innovative health technologies.

SP021.6 - An innovative Decision Support System (DSS) for patients with Inflammatory Bowel Disease (IBD)

Author(s): Evaggelos C. Karvounis¹, <u>Vasileios E. Tsianos</u>¹, Kallirroi Kyriakidi¹, Epameinondas V. Tsianos²

¹Research Laboratory Of Hepato-gastroenterology, Division Of Gastroenterology, Faculty Of Medicine, School Of Health Sciences, University of Ioannina, Ioannina/GREECE, ²1st Division Of Internal Medicine And Division Of Gastroenterology, Faculty Of Medicine, School Of Health Sciences, University of Ioannina, Ioannina/GREECE

In IBD, investigators have suggested a possible role of various infective agents and recent epidemiological studies and veterinarian reports have reconsidered the pathogenetic role of some microbes and/or related vectors to the potential pathogenesis of some human disease. The etiopathology of IBD still remains unknown. The combined use of lifestyle surveys associated with blood samples and relevant clinical registers seems the best methodology to identify possible links between genetic predisposition, disease occurrence and natural course of the disease.

Such a system will help understand the natural course of the disease, study the predisposing factors and related genes and determine early clinical, genetic and immunological predictors of outcome and response to treatment. We build an efficient personalized web-based platform, in order to manage medical data, using efficient data mining and knowledge extraction techniques. Various variables already defined and determined for which associations are searched within the recorded datasets, discover interesting interrelations and extract new knowledge from multiple and heterogeneous archived data that reflect everyday lifestyle and medical information, examine the results of previous therapeutic regimens and obtain quantitative explanations of the observations and generate efficient reports with intelligent data visualization.

We create an innovative clinical DSS, an efficient web-based platform, which incorporates 2 modules: Data Repository and Knowledge Discovery/Statistics module. The Data Repository module is a centralized data repository for annotation data (clinical, demographic and experimental data), sample source and handling information, processing and quality assurance information, as well as inventory and process flow data. In the front end, it will provide tracking, data query, report generation, process management functions, data handling as well as statistics, data mining and knowledge extraction capability (Knowledge Discovery and Statistics module incorporated in the back-end of the system). Moreover, the module will contain a Data Representation module that will handle the presentation of the extracted knowledge from the patients' data.

For the Data Repository module, a secure database has already been developed. For old patients, medical data from almost 600 patients, using their hard-copy medical records, have already been digitized. Blood sampling has already been achieved in 294 new patients and 234 healthy volunteers, while the results of the genetic (susceptibility gene polymorphisms) and serological (inflammatory and serological prediction markers) study are recorded in the database. Several knowledge discovery techniques have been applied in the Databases, giving more than satisfactory results.

Building such a system, for the first time in Greece, will contribute even more to IBD knowledge and research as the proposed system will create a unique multidisciplinary combined database with combination of clinical, environmental and laboratory data in IBD. In addition, as IBD is regarded to be a multifactorial disease, we hope to better define some factors that clearly predispose to certain IBD phenotypes and IBD disease course. Finally, we hope that the computerized platform will enrich our experience and will contribute towards a better IBD education and training in our medical, nursing and laboratory personnel and serve as a model and a basis for research in other chronic gastrointestinal and/or inflammatory diseases.

SP022 - Educational and Professional Activities: Part 1

PRESIDENTS CALL

SP022.1 - Biomedical Engineering in Nigeria: A Developmental Overview

Author(s): <u>Kenneth I. Nkuma-Udah</u>¹, Eillen E.C. Agoha², Kennedy O. Ejeta³, Gideon I. Ndubuka³

¹Department Of Biomedical Engineering, Federal University of Technology, Owerri, Nigeria, Owerri/NIGERIA, ²Food Sciences And Technology, Abia State University, Uturu,, Uturu/NIGERIA, ³Department Of Biomedical Technology, Federal University of Technology, Owerri, Nigeria, Owerri/NIGERIA

Biomedical Engineering (BME) activities in Nigeria can be said to have started in the 1970s during which collaborative efforts were made by engineers, medical doctors, pharmacists, physicists, technicians and other scientist. Although, the pace of development was hitherto slow, most efforts were in the area of training - short courses, continuing education or professional development. However, the coming of NIBE in 1999 has propelled a steady progress of BME activities in Nigeria. BME activities in Nigeria was further given a big boost in 2007, when the first undergraduate programme in BME started in the Federal University of Technology, Owerri, Nigeria with NIBE contributing the foundation members of faculty. Established in 1999 with the vision "to develop and advance the biomedical science, health and human well-being of Nigeria through modern technological approaches comparable to those obtainable in any developed country of the world". NIBE is currently structured in 5 divisions - biological engineering; medical engineering; clinical engineering; rehabilitation engineering; and biomedical physics / allied sciences - to accommodate virtually every field in the sciences. It had its 1st annual BME conference in 2000. Since then it has organised 9 national biomedical engineering conferences and 6 national professional development courses in Nigeria. In 2003, NIBE was admitted as the 50th member of IFMBE. The same year, she co-founded the African Union of Biomedical Engineering and Sciences (AUBES) in Ghana while some members were on a Medical Equipment Training. The role of NIBE in developing BME in Nigeria is mainly as a membership group to develop resources for BME by evolving adequate training programmes for members, facilitating accreditation and certification of professionals practicing BME in Nigeria.

SP022.2 - Modernising Scientific Careers – a new scheme for the education and training of physicists, engineers and other scientific staff in the UK National Health Service Author(s): <u>Keith Ison</u>¹, Chris Gibson², Sarah Peel¹, Sue Hill³ ¹Medical Physics Department, Guy's and St Thomas' Hospital, London/UNITED KINGDOM, ²National School of Healthcare Science, Birmingham/UNITED KINGDOM, ³NHS England / Health Education England, Leeds/UNITED KINGDOM

Modernising Scientific Careers (MSC) is a UK-wide government initiative to address training and education of the NHS healthcare science workforce (2011). MSC provides a flexible career pathway to meet current and future health system needs via a single coherent training framework across 50,000 healthcare scientists of all disciplines including medical physicists and clinical engineers.

MSC covers all career stages, and the associated training and education programmes incorporate both academic and workplacebased training. Early training is broad based with greater specialisation in the more advanced programmes. The intent is to develop a skilled yet flexible workforce with sustainable education and training funding. It is already being developed to cover Medical Physics Experts and public health scientists.

The MSC career pathway has four stages and qualifications (2014a):

Assistant and associate training – vocational qualifications for **scientific support roles**

Practitioner Training Programme (PTP) – BSc for healthcare **science practitioners**

Scientist Training Programme (STP) - Masters for clinical scientists

Higher Specialist Scientific Training (HSST) – five year doctoral level programme for **consultant clinical scientists** (2014b)

The presentation will outline evidence-based approaches to trainee selection, progress monitoring and assessment and also report initial outcomes. MSC is competency-based and scientists and engineers often approach competencies in a linear fashion, breaking complex real-world scenarios into discrete tasks with defined right answers that do not fully reflect clinical reality or capture all necessary learning. In progressing from academic achievement to professional competence, we propose that trainees should be encouraged to document real workplace processes, acknowledge and reflect on uncertainty, and develop strategies to respond appropriately. These documents would encourage all staff to consider reflective practice as integral to professional competence.

Department of Health (2011) *An overview of Modernising Scientific Careers.*

Modernising Scientific Careers: Career and Training Pathways

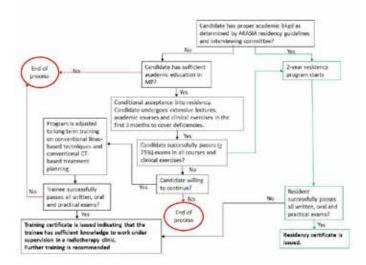

Program							
Education Programme	Duration	Entry requirement	Level	Funding			
Assistants, Associates	Up to 3 years	Varies	Varies	Employer			
Practitioner Training Programme	3 years	University selection	BSc	Student with NHS placement contribution			
Scientist Training Programme	3 years	BSc in rel- evant area	MSc	Commissioned and funded centrally or in- service funded by employers and fees paid centrally			
Higher Specialist Scientist Training	5 years	Clinical Scientist registration	Doctoral level (DClin- Sci / PhD)	Salary sup- ported by employers with external training allowance			
Accred- ited Scien- tific Practice post registration / regulation	1 - 2 years	Depends on programme	Depends on pro- gramme, eg postgradu- ate Medical Physics Expert- gramme, eg post	Academic component em- ployer funded			

SP022.3 - Medical Physics Residency Program in Developing Countries: Lessons, Challenges and Solutions Learned from a Regional Pilot Training Program

Author(s): Shada Wadi-Ramahi, Waleed Al-Najjar, <u>Belal Moftah</u> Biomedical Physics, King Faisal Specialist Hospital and Research Center, Riyadh/SAUDI ARABIA

A regional 2-year structured program in medical physics was established at our institution. The program is supervised by board certified physicists with the objective of graduating clinically qualified medical physicists. The structure of the program is such that all residents undergo the same learning modules during the allotted time. However, we faced many challenges in terms of the competencies and expectations of the candidates, as they came from different countries in the region. MSc level candidates exhibited varying levels of academic competencies, and the clinical expectation varied by country; From conventional treatments using Co-60 to state-of-the-art treatments on linacs. Challenges faced include how to cover various academic deficiencies, which required time-consuming per needed lectures, another major challenge was how to transition Co-60 users into linac users while dealing with other residents who wanted to advance more in linac-based techniques. A third major challenge was how to evaluate the various competencies achieved at the end of the 2 years, given the starting level and background, of course many other challenges presented themselves during the years. In this paper, we present a detailed description of our residency program, the modules it contains and expected competencies, then we discuss in more details the challenges we faced given the heterogeneous mix of the residents and the solutions that evolved, and still is evolving, to overcome these hurdles. Residency programs covering many countries, in which one cannot control education levels, have to evolve and adapt in order to produce useful results. A one-size-fits-all formula found in North America, for example, will fail if copied as is and implemented in developing countries.

SP022.4 - International Union of Biological Sciences Author(s): <u>Nils Chr. Stenseth</u>

Université Paris Sud Xi, IUBS, Orsay/FRANCE

The International Union of Biological Sciences (IUBS) was established in 1919. IUBS is presently composed of 27 National Members and 80 Scientific Members. The role of IUBS is to promote the study of biological sciences, to initiate, facilitate and coordinate research and other scientific activities necessitating international, interdisciplinary cooperation, to ensure the discussion and dissemination of the results of cooperative research, particularly in connection with IUBS scientific programmes. IUBS sponsors the organization of conferences and also scientific programmes. The current IUBS programmes are dealing with climate change, bionomenclature, Disaster and biodiversity, and also a case study on Bees and Coffee.

The bio-cluster meeting will be a good opportunity to discuss how the different bio-unions programmes and activities could interact for the benefit of our community. On the other hand, it is important to develop our interaction with ICSU and with its programme Future Earth. The bio-cluster of ICSU should discuss and propose ways to improve our participation in this important ICSU programme.

SP022.5 - Promoting the public image of Medical Physicists and Biomedical Engineers Author(s): Michael Cheng

Biomedical Engineer, Ottawa/ON/CANADA

This paper focuses on the alert raised by the IUPESM President that "In many developing countries, there are no physicists or engineers in clinical settings; in developed nations, physicists and engineers are losing their positions in hospitals." The author offers his personal viewpoints derived from the past 30 years in more than 30 developed and developing countries around the world working on medical device regulations and management issues. The conclusion proposed collaborative summit brainstorming.

Despite their technical talent and devotion to their work, most medical physicists (MP) and biomedical/clinical engineers (BME/CE) have less skills in promoting themselves to the public. I think this phenomenon is a weakness that needs to be addressed. We know that industries and some politicians will hardly succeed if they do not make themselves known to the public. The professions must seek ways to promote their public image. I will describe two domains where the merits of the MP and BME/CE are huge but under recognized by the public: 1. MP, BME/CE are principal builders of healthcare technology; 2. MP and BME/CE play vital roles in patient safety with medical devices in healthcare facilities. Then, I will propose outreach to developing countries with references to simple knowledge transfer tools described in two education sessions offered by this Congress WC2015. Lastly, I will suggest examples of opportunities for research to help emerging global health issues, and opportunities to develop personal medical technologies to empower personalized medical care and encourage patient responsibility. A full paper is also submitted with this abstract; the descriptions in the full paper also make references to four other submissions (see below) to this Congress WC2015.

In order to promote the public image of MP and BME/CE, the hurdles to overcome are complex; therefore an appropriate strategy to "market" their huge contributions to global healthcare should be a key topic for collaborative summit brainstorming called by the President.

SP022.6 - The Utilization and Design of Doorless Mazes for Medical Linear Accelerator Rooms In Ontario, Canada

Author(s): Joseph J. Szabo

Walker Family Cancer Centre Physics, Niagara Health System, St. Catharines/CANADA

Medical linear accelerator rooms in typical cancer centres use mazes for radiation protection, but these are usually short and straight and still require a heavy shielding door at their entrance. Especially for treatment energies higher than 10 MeV the purpose of the door is to attenuate both photons and neutrons that have scattered down the maze, as well as capture gamma rays created by neutrons in the concrete walls, ceiling, floor, and ultimately in the door itself. This radiation must be dealt with to secure the therapy staff working in the control area near the room entrance. Depending on the length of the maze, the door may have to attenuate scattered photons, moderate fast and intermediate neutrons, and finally attenuate capture gamma rays. This requires often massive and cumbersome doors, which usually consist of an initial layer of lead to attenuate the scattered photons and the maze generated capture gamma rays, followed by another layer of quite thick, highly hydrogenous material such as borated polyethylene, to moderate fast and intermediate energy neutrons into low energy thermal neutrons, which then are effectively captured by the boron, while only releasing capture gamma rays of a relatively low energy (0.473 MeV). A final layer of lead at the outside of the door is used to block these capture gamma rays. All this is usually quite heavy, resulting in a door that is 10's of centimeters thick and thousands of kilograms in weight, often requiring tracks and motors to operate, which makes it quite expensive. Also, moving such a heavy door is usually slow and since the door is likely opened and closed more than hundred times a day, it is prone to wear, requiring expensive continuous maintenance. And in the event of a breakdown a manual technique for opening must be available. All this can be avoided if one uses a longer maze. In 1991 the author designed a maze that required no door at all. This maze

was first put into clinical use in the city of Kingston and was the first maze without a door in the province of Ontario. After the successful implementation of this design, it was utilized in all new clinics and many of the older clinics in all of Ontario. In addition, it has been used elsewhere in Canada as well as in parts of the United States. However, in other parts of the world the doorless bunker is still not very well known. This paper is a review of the extent of the use of this design as well as detailed instruction on how to build it to minimally take up real estate by use of multiple bends and strategically placed polyethylene and borated polyethylene panels to reduce the neutron flux well before it reaches the maze entrance. Calculation methods and measurements from the radiation survey for the most recent construction will be shown. In that case the results were so good that the author was actually concerned that his survey meters were not functioning.

SP023 - Quantitative Imaging: Part 1

TRACK 01: IMAGING

SP023.1 - Improving quantitative functional imaging with dynamic contrast enhanced studies using a linearized Johnson-Wilson model approach

Author(s): Fiona Li¹, Ting Yim Lee²

¹Department Of Medical Biophysics, Western University, London/ ON/CANADA, ²Lawson Health Research Institute, London/ON/ CANADA

Background

The standard two compartment (2-C) model, consisting of vascular and tissue compartments, is frequently used to fit tissue time density curves (TDCs) from dynamic contrast enhanced (DCE) CT or MR studies. However, the compartmental assumption for the vascular space means that the finite vascular transit time is ignored. As image acquisition speed increases beyond 0.5 Hz, parameters estimated by fitting the tissue TDC with the two 2-C model without accounting for the finite vascular transit time could be biased. Also, 2-C model is unable to estimate blood flow (F), it estimates Ktrans instead, which is the flow extraction efficiency product. On the other hand, fitting tissue TDC using the Johnson-Wilson model with the adiabatic approximation (aaJW) will provide estimates of both Ktrans and F that are independently important for investigations of tumor associated angiogenesis. Current applications of the aaJW model use non-linear curve fitting methods to estimate Ktrans and F. These methods are prone to be trapped in local minima while searching for the optimal fit to the tissue TDC resulting in erroneous estimates of model parameters.

Purpose

To develop a method to linearize the fitting of DCE tissue TDC with the aaJW model and compare the method's sensitivity to model parameters and covariances of estimated parameters with non-linear fitting **methods**

Method

Linearization of 2-C model fitting of tissue TDC has been published before but no attempts to-date have been made for linearization of aaJW model fitting. The method we developed to linearize aaJW model fitting of the tissue TDC is based on time integrals of the arterial TDC (Cp(t)) and the tissue TDC (Q(t)). The stability of the linear and non-linear fitting methods were analyzed using sensitivity analysis which calculated the changes in the fitted tissue TDC with changes in the model parameters or sensitivity functions of both fitting methods. The sensitivity functions were used to estimate the covariances of the estimated parameters for both methods.

Results

The equations for tissue TDC fitting with the aaJW model are:

Non-linear: $Q(t) = F \cdot [D(t-to)-D(t-to-W)] + K1 \cdot Cp(t-to-W)^* exp(-k2 \cdot (t-to-W))$

Linear: Q(t) = $F \cdot [D(t-to)-D(t-to-W)] + K1 \cdot D(t-to-W) + F \cdot k2 \cdot [E(t-to)-E(t-to-W)] - k2 \cdot G(t)$

where * is convolution operator, to is the delay between Q(t) and Cp(t), W is the vascular transit time, K1=Ktrans, k2 is backflux rate constant, D(t) is the integral of Cp(t), E(t) is the integral of D(t) and G(t) is the integral of Q(t). The sensitivity functions for the linear fit-

ting method were ~ 5 times larger than those of the non-linear fitting method resulting in the covariances of estimated parameters from the linear fitting method > 1.3 times less than those of the non-linear fitting method.

Conclusions

Unlike the non-linear fitting method, the linear method estimates model parameters at the unique global minimum sum of squared deviations between the fitted and the measured tissue TDC. More importantly, the covariances of the estimated model parameters are significantly less for the linear method than the non-linear method. This would lead to more precise quantitative functional maps from DCE studies and more reliable diagnosis.

SP023.2 - Early tumor Response assessment using volumetric DCE-CT and DCE-MRI in Metastatic Brain Cancer Patients Author(s): <u>Catherine Coolens</u>¹, Brandon Driscoll¹, Warren Foltz¹, Cynthia Menard¹, Gelareh Zadeh², David Jaffray¹, Caroline Chung¹ ¹Radiation Medicine Program, Princess Margaret Cancer Centre, Toronto/CANADA, ²Division Of Neurosurgery, University Health Network, Toronto/CANADA

Introduction: Early change in tumour vascularity following stereotactic radiosurgery (SRS) is a potential biomarker of response. Dynamic contrast enhanced (DCE) MRI is often used to interrogate perfusion but has known limitations to accuracy and precision. Progress in CT technology now allows for volumetric acquisition with 4D temporal dynamic analysis (TDA) of perfusion. As such, DCE-CT presents as a standard for tracer-kinetic validation. This study aims to compare DCE-MRI analysis against DCE-CT supported by a common TDA framework and to evaluate if DCE-MRI and DCE-CT parameters can detect changes in tumor vascular physiology that predict for tumor response to SRS.

Methods: Patients with brain metastases (total of 14 tumours) treated with SRS as part of REB-approved clinical trials underwent volumetric DCE-CT (Toshiba, Aquilion ONE) and DCE-MRI (IMRIS 3T Verio, Siemens) scans at baseline then 7 and 21 days post-SRS. DCE-CT parameters were: 80kV, 100mAs, 1sec interval and 0.468x0.468x1mm. VFA T1 quantification and DCE MRI acquisitions used 3D-FLASH with matching echo times (1.86 msec), repetition times (4.8 msec), and geometric features (1.15x.1.15 mm in-plane resolution, 40 slices at 1.5 mm each). DCE-MRI used a 20° flip angle, and 45 frames were acquired every 5.8 sec. Voxel-based whole brain TDA was performed on both DCE-CT and DCE-MR data using in-house software. Perfusion, permeability and Area-under-the-Curve (Ktrans, Ve, AUC) were assessed within each tumour at every time point using the Modified Tofts model and a linear regression was done of temporal changes in these parameters over treatment. Correlation between these vascular parameters and treatment response, evaluated as stable or reduction in tumor volume was assessed.

Results: At Day 21 only one tumor had a volume that remained larger than at baseline while the other tumors showed a decrease in volume of (mean of 53.6 +/- 31%). <u>DCE-CT:</u> 3 of 8 stable or responding tumours revealed a Ktrans reduction of 44.6+/-36.6% (p=0.056) at Day 7 post-RS while 10 out of 13 responding tumours had a reduction in Ktrans of 26.0 +/- 16.6 % by Day 20 (p < 0.01). Only one of the non-responding tumours showed a decrease in Ktrans at Day 7 while none did at Day 20. <u>DCE-MRI.</u> 7 of the 8 stable or reducing tumours revealed a Ktrans reduction of 17.4+/-16.6% (p<0.05) at Day 7 post-RS while 10 out of 13 responding tumours had a reduction in Ktrans of 24.0 +/- 20.3 % by Day 20 (p < 0.05). MRI results showed weak overall correlations with DCE-CT at either Day 7 (R2=-0.16) or Day 20 (R2 = 0.21) for Ktrans. AUC changes did not correlate significantly with either time point or modality.

Conclusions: This is the first study evaluating perfusion parameters acquired by same-day volumetric DCE CT and DCE MRI in a cohort of metastatic brain patients. The weak correlation between MRI and CT results may reflect issues such as sensitivity to arterial input, tumour type, definition of response, and edema that are under further investigation. These early results show Ktrans reduction at day 20 may predict for eventual tumor response post-SRS.

SP023.3 - Diffusion tensor imaging is correlated with quantitative histology in surgically-resected hippocampi of epilepsy patients

Author(s): Maged Goubran¹, Boris Bernhardt², Charlotte Blinston¹, Diego Cantor-Rivera¹, Jonathan C. Lau³, Robert R. Hammond⁴, Sandrine De Ribaupierre⁵, Jorge G. Burneo³, Seyed Mirsattari³, David A. Stevens³, Andrew G. Parrent³, Andrea Bernasconi², Neda Bernasconi², <u>Terry Peters</u>⁵, Ali R. Khan⁵

¹Imaging, Robarts Research Institute, London/ON/CANADA, ²Mcconnell Brain Imaging Center, Montreal Neurological Institute, Montreal/QC/CANADA, ³Epilepsy Program, Clinical Neurological Sciences, Western University, London/ON/CANADA, ⁴Pathology, Division Of Neuropathology, Western University, London/ON/CANADA, ⁵Medical Biophysics, Western University, London/ON/CANADA

Introduction

Hippocampal sclerosis (HS) is the most common pathology seen in mesial temporal lobe epilepsy (MTLE) patients, and studies have shown a relationship between the pattern of sclerosis and postsurgical outcomes (seizure freedom and memory impairment). Thus, predicting these pathological sub-types pre-operatively can play a significant role in pre-surgical management of TLE patients. Diffusion tensor imaging (DTI) has shown to be a sensitive marker of microstructural changes but the precise relationship of diffusion markers with HS subtypes is not well known. The current study aims to assess these relationships by comparing pre-operative imaging with quantitative markers of neuropathology from histology of the tissue resected after surgery.

Methods

Patients (N=15) undergoing temporal lobectomy were recruited for this study and imaged pre-operatively in a 3T MRI using a research protocol that included diffusion tensor imaging (41+6 directions, 2.5mm isotropic resolution). Tissue was resected en-bloc and prepared for histological processing. Histology slides were cut, stained with H&E, NeuN (neuronal marker) and GFAP (glial marker) for quantitative histology assessment. Hippocampal subfields (CA1, CA2/3, CA4/DG) were manually segmented in the pre-operative MRI and histology slides, and spatial correspondences were found using our validated MRI-histology image registration pipeline. Automated histology image processing was performed to extract maps of neuron density, size, and gliosis, and were correlated against mean diffusivity (MD) and fractional anisotropy (FA) of the corersponding slice.

Results

Histological data for two subjects were discarded due to insufficient tissue to assess delineate the subfields, thus correlations were computed with 13 patients. Mean diffusivity (MD) in the end folium (CA4/DG) was significantly correlated with the number of neurons in CA4 (r=-0.833, p<0.001) and the size of neurons in CA4 (r=-0.841, p=0.039). An increase in the extracellular space could explain the significant increase in MD in samples which contained fewer neurons or neurons with smaller average size.

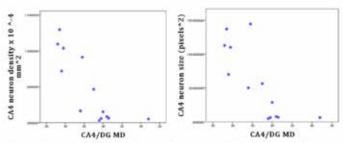

Figure 1: Scatter plots showing significant correlations between diffusion parameters (MD) and quantitative histology (neuron density, neuron size).

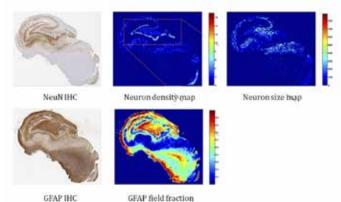

Figure 2: Example of immunohistochemical (IHC) staining of the hippocampus for neuronal markers (NeuN) and glial markers (GFAP), along with quantitative maps derived from these images (neuron density, neuron size, glial field fraction).

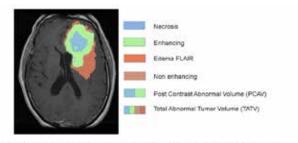

SP023.4 - Evaluation of fully automatic volumetric GBM segmentation in the TCGA-GBM dataset: Prognosis and correlation with VASARI features

Author(s): <u>Emmanuel Rios Velazquez</u>¹, Raphael Meier², William D. Dunn Jr³, Brian Alexander⁴, Roland Wiest⁵, Stefan Bauer², David A. Gutman³, Mauricio Reyes², Hugo J.W.L. Aerts⁴

¹Radiation Oncology, Dana-Farber Cancer Institute | Harvard Medical School, Boston/UNITED STATES OF AMERICA, ²Institute for Surgical Technology and Biomechanics, Bern/SWITZERLAND, ³Department Of Biomedical Informatics, Emory University School of Medicine, Atlanta/GA/UNITED STATES OF AMERICA, ⁴Radiation Oncology, Dana-Farber Cancer Institute, Brigham and Women's Hospital, Harvard Medical School, Boston/UNITED STATES OF AMERICA, ⁵Support Center For Advanced Neuroimaging (scan), Institute for Diagnostic and Interventional Neuroradiology, University Hospital Inselspital and University of Bern, Bern/SWITZERLAND

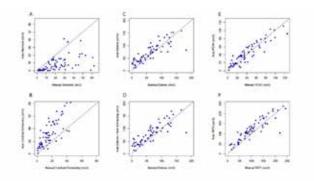

Background: Reproducible definition and quantification of imaging biomarkers is essential. We evaluated a fully automatic MR-based segmentation method by comparing it to manually defined sub-volumes by experienced radiologists in the TCGA-GBM dataset, in terms of sub-volume prognosis and association with VASARI features.

Methods: MRI sets of 67 GBM patients were downloaded from the Cancer Imaging archive. GBM sub-compartments were defined manually and automatically using the Brain Tumor Image Analysis (BraTumIA). Spearman's correlation was used to evaluate the agreement with VASARI features. Prognostic significance was assessed using the C-index.

Tumor sub-compartments as defined by the BraTuntiA software. A post contrast abnormal volume (PCAV) was defined as the sum of the necrotic and contrast enhancing volumes. The total abnormal volume (TATV) was defined as the sum of the four sub-compartments: necrosis, enhancing region, non-enhancing region and edema. Note that the non-enhancing tumor region was not manually contumed and therefore the TATV manual was defined as the sum of necrosis, enhancing and edema regions.

Results: The auto segmented sub-volumes showed high agreement with the manually delineated volumes (range (*r*): 0.65 - 0.91). Additionally, auto-segmented volumes showed higher correlation with the VASARI features (auto r = 0.35, 0.60 and 0.59; manual r = 0.29, 0.50, 0.43, for percentages of contrast-enhancing, necrosis and edema, respectively). The relative contrast-enhancing volume and the post contrast abnormal volume (necrotic core + contrast enhancing region) showed the highest C-index (0.73 and 0.72), comparable to manually defined volumes (p = 0.22 and p = 0.07, respectively). The non-enhancing region defined by BraTumIA showed significantly higher prognostic value (CI = 0.71) than the tumorassociated edema (CI = 0.60), both of which could not be separated by manual delineation.

Scatter plots showing the correlation between different tumor regions as defined fully automatically or manually drawn. Necrosis showed the weakest correlation (A, r = 0.65). Stronger correlations were found for the contrast enhancing and FLAR envelope regions, (B, r = 0.79) and (C, r = .85), respectively. PCAV (necrosis + enhancing regions) and the TATV (sum of all sub-compartments), r = 0.90 and r = 0.91, showed strong correlation as well between automatic and manual segmentation (E - F).

Conclusion: BraTumlA tumor sub-compartments showed higher correlation with VASARI data, and equivalent performance in terms of prognosis compared to manual sub-volumes. This method can enable more reproducible definition and quantification of imaging based biomarkers and has a large potential in high-throughput medical imaging.

SP024 - Breast CAD and New Breast Imaging Techniques

TRACK 01: IMAGING

SP024.1 - Modelling Breast Cancer Tissue via Analysis of WAXS Signatures

Author(s): Robert J. Leclair Physics, Laurentian University, Sudbury/CANADA

A wide-angle x-ray scatter (WAXS) method to guantify the composition of cancerous tissue is described. The modeling of cancerous tissue is accomplished by analysis of the differential linear scattering coefficients µs of fibroglandular (fib) [µs,fib], cancerous breast tissue (µs,cancer) and water (µs,h2o). A model assumed that cancer consisted of fib and a volume of cancerous cells. Most of the scattering properties of the cells can be attributed to water since cells are composed primarily of water. In this work, the volume of cancerous cells was approximated by a volume of water. A two basis function method was used to estimate the μ s of cancer, namely μ s, cancer(x) = afib μ s,fib(x) + ah2o μ s,h2o(x) [Eq. 1], where μ s,fib(x) and μ s,h2o(x) are the basis functions, afib and ah2o are coefficients. The variable $x = (1/\lambda) \sin(\theta/2)$ is the momentum transfer which combines dependence of scatter on x-ray wavelength (λ) and scatter angle θ . A system of 78 equations corresponding to x values ranging from 0.80 to 3.2 nm⁻¹ was constructed. The coefficients afib and ah2o of this overdetermined system were calculated via lest-squares using the singular value decomposition (svd) method. The coefficients were also used to estimate fractional volumes v of fib (vfib) and h2o (vh2o), namely vfib= afib/(afib+ah2o) and vh2o= ah2o/(afib+ah2o). These v values were then used to estimate another more meaningful μ s estimate of cancer given by μ s,cancer (x) = vfib μ s,fib(x) + vh2o μ s,h2o(x) [Eq. 2]. For one set of diffraction data, afib = 0.23, ah2o = 0.73, vfib = 0.24 and vh2o =0.76 and for the other set afib = 0.83, ah2o = 0.31, vfib =0.73 and vh2o =0.27. For the first set of data both µs estimates (i.e. Eqs. 1 and 2) matched the measured µs cancer well whereas for the latter only the µs via Eq. 1 provided a reasonable match. The modeling of cancerous tissue via analysis of WAXS signals is an interesting method to learn more about the characteristics of cancer. It was not surprising to see differences in predictions when using different WAXS data for breast tissue since they were different in the first place. The different results obtained justify the needs for more studies on the acquisition of WAXS signals of breast tissue. The presence of fat tissue could have affected the WAXS signals. In a future work, a WAXS fat subtraction protocol will be implemented in order to measure the µs coefficients of fib and cancerous tissue without the effects of fat. The measurements of us for cells will also be done. Such data will help in characterizing the make-up of cancer and help determine the potential diagnostic use of WAXS.

SP024.2 - Analysis of 80 kV WAXS Measurements with a CdTe Breast Biopsy Diffractometer

Author(s): <u>Nancy Mcdonald</u>, Robert J. Leclair Physics, Laurentian University, Sudbury/CANADA

The wide-angle x-ray scatter (WAXS) signatures of breast tissue may provide an additional source of diagnostic information in the realm of breast diagnostics. Measurements to test the ability of exploring a larger momentum transfer *x* space with a custom built breast biopsy CdTe diffractometer were performed. 80 kV 3.2 mm diameter beams of 3 min duration interrogated 5 mm diameter, 2 to 5 mm thick samples of polymethyl methacrylate (PMMA) and polycarbonate as well as a 5 mm thick water sample. Scattered spectra Ns(E)

were detected at $\theta = 6^{\circ}$ with a 25 mm² × 1 mm thick CdTe detector. A 3 mm diameter aperture placed 4 cm above the detector yielded a solid angle of detection $\Omega = 4.9 \times 10^{-5}$ sr at the sample center. The probed x range was from 0.3 nm⁻¹ to 3.38 nm⁻¹. Linear differential scattering coefficients us were calculated via a semianalytical model and compared qualitatively with µs calculated using coherent form factors and incoherent scatter functions from the literature. Because of the use of a higher kV beam, the effects associated with florescence escape and hole tailing in the CdTe crystal were investigated via the application of a detector response function. The incident spectrum N0(E) was estimated via application of the scatter model in reverse fashion using measurements of Ns and literature µs of plastics. Plastics of varying thicknesses were used to estimate N0(E). The µs of a 5 mm thick water sample matched fairly well with literature between 0.42 nm⁻¹ < x < 1.68 nm⁻¹, however, above this region discrepancies occurred. No significant effects were observed when using different sample thicknesses to obtain N0(E). The same comparisons were performed for a 5 mm thick PMMA sample. These results matched well with literature over the whole range. It is anticipated that some of the pinhole scatter interacted with the Pb holder and then contaminated the Ns spectra. The contamination would be similar for both plastics because of their similar µ values. Regardless, if the µ of the sample being analyzed are similar to those of the sample used to get N0, the system is capable of probing a wider x range using an 80kV beam. The detector response function did not have a significant effect on the µs curves.

SP024.3 - AM-FM features for the classification of Regions of Interest towards the Development of a Breast Cancer Density Specific Computer Aided Detection System

Author(s): Styliani Petroudi¹, Ioannis Constantinou¹, Chrysa Tziakouri², Athos Antoniades¹, Christakis Charalambous¹, Marios Pattichis³, <u>Constantinos Pattichis¹</u>

¹University of Cyprus, Nicosia/CYPRUS, ²Nicosia General Hospital, Nicosia/CYPRUS, ³University of New Mexico, Albuquerque/UNITED STATES OF AMERICA

Breast Cancer is the most common cancer in women worldwide. As mammographic double interpretation is not possible everywhere, and with the number of cases rising in addition to time and cost constraints, the development of Computer Aided Detection (CAD) systems with high sensitivity and high specificity is important. Mammographic breast density refers to the prevalence of fibroglandular tissue as it appears on a mammogram and it is an important breast cancer factor risk. Furthermore, breast density may mask abnormalities and/or lower the sensitivity of mammography. The development of density specific CAD systems coupled with automated breast density classification may alleviate the problem by achieving high sensitivity and specificity for certain breast density classes. Women with high breast density may seek supplementary screening - in addition to mammography. Amplitude-Modulation Frequency-Modulation based features have been successfully used to characterize mammographic breast density and to automatically classify mammograms into one of the four Breast Imaging Reporting and Data Systems (BI-RADS) mammographic breast density classes.

This work, presents initial results on the use of multi-scale Instantaneous Amplitude (IA), Instantaneous Phase (IP) and Instantaneous Frequency (IF) information from Amplitude-Modulation Frequency-Modulation (AM-FM) decomposition for the classifications of Regions of Interest (ROIs) from low density mammograms to either normal or cancerous/malignant. A Gabor filter-bank using eight orientations and six different frequency scales is applied for AM-FM demodulation. Dominant component analysis is used for the evaluation of IA, IF and IP at each frequency scale. The IA amplitude reflects local image intensity variations, e.g. edges, with different spatial scale variations reflected in different frequency scales whilst the IF measures local frequency content. First and second order statistical features are evaluated on each of the normalized histograms of the components across the different scales and are used for characterizing the ROI. Support Vector Machines (SVMs) are used for ROI classification.

All mammograms from the Mammographic Image Analysis Society Database that are classified as fatty are used for the development and the evaluation of the presented CAD system. Regions of different size - segmented using block processing from the mammograms classified as normal-, and the ROIs that hold biopsy proven malignancies (well defined masses, speculated masses, other ill-defined masses, architectural distortion and asymmetry but not calcifications) are used for training the SVM classifier. The SVM with RBF kernel is investigated using tenfold cross validation in order to identify the best parameters. The developed CAD system achieves accuracy over 80%, with sensitivity over 85% and specificity over 75% for all types of masses. The prediction results, achieved using the SVM classifier, are very encouraging. Similar CAD systems using different AM-FM with additional texture features will be developed and evaluated specifically for other mammographic density classes.

SP024.4 - Single Scatter Signals during Dual Detector Volume-of-Interest Breast Cone-Beam Computed Tomography: A New Source of Diagnostic Information? Author(s): <u>Curtis Laamanen</u>, Robert J. Leclair Physics, Laurentian University, Sudbury/CANADA

Dual detector breast volume-of-interest (VOI) cone-beam computed tomography (CBCT) is a technique that uses two scans to generate higher quality details of a VOI. A full field scan is acquired at low exposure with a flat panel detector whereas a high resolution scan of the VOI is acquired with a high resolution CMOS detector at higher exposure. The data obtained at lower exposure/resolution is used in conjunction with the higher quality VOI data to reconstruct images. The effects of scattered x rays on details within the VOI are reduced by this technique. In this work it is proposed that during the high resolution scan it could be beneficial to also use the flat panel detector to capture some scattered photons from the VOI for diagnostic purposes. Simulations were performed to assess the potential use of the single scatter that could be captured during the high resolution scan. A 14 cm diameter 10.5 cm long cylinder with an embedded 2 cm diameter spherical lesion was considered. Fibroglandular (fib) and water spheres were chosen to represent benign and cancerous lesions. The following percent mass compositions for the cylinder were considered: 80(fib):20(fat), 60:40, 50:50, 40:60, and 20:80. The distance from the source to iscocenter was 58 cm and from the isocenter to detector plane 28 cm. Using a 60 kV beam with an HVL of 3.7 mm Al, energy integrated signals (EIS) were computed for each of the 300 × 300 1 mm² pixels. In normal full field breast CBCT, a typical mean glandular dose of 6 mGy is used. In this work, the VOI scan had an exposure 4× higher than that of the regular full-field CBCT. The incident cone beam irradiated the smallest VOI which included the spherical lesion. The EIS due to scatter (EISs) from the VOI were calculated for both fib and water lesions embedded in the different cylinder compositions. Since contrast reversal occurred across the detector, the information content was increased by adding pixels selectively. Pixels including signals from primary photons were not included in the summations. The variances in pixel signals were based on the propagation of Poisson noise in ideal energy integrating pixels. The signal-to-noise ratio in terms of EISs for malignant versus benign lesions within cylinders of the same composition were on the order of 20 thereby suggesting potential usefulness of the x-ray scattered photons. A problem

that needs to be addressed, however, is that there were significant variations in signals as a function of cylinder composition for a given lesion type. A study which includes a method to estimate the composition of the main phantom will be conducted.

SP024.5 - Investigating automatic techniques in segmentation accuracy of masses in digital mammography images Author(s): <u>Karem D. Marcomini</u>, Homero Schiabel

Dept Of Electrical Engineering, University of São Paulo, São Carlos/ BRAZIL

Many procedures have been developed to aid in the early detection and diagnosis of breast cancer. In this context, Computer-Aided Diagnosis (CAD) schemes were designed to provide to the specialist a reliable second opinion. In such schemes there is a complex step which corresponds to the segmentation since good structures classification is dependent on the features extracted from the segmented images. In this work we propose the use of several methods of automatic segmentation of breast lesions, such as: watershed, fuzzy c-means, k-means, Self-Organizing Map (SOM), Enhanced Independent Component Analysis Mixture Model (EICAMM) and level set. In order to evaluate which of them could provide more accurate results in segmenting breast masses segmented images were compared with those manually delimited by an experienced radiologist. Ten quantitative measures were obtained from the images. These segmentation techniques were applied on different types of lesions, including images corresponding to dense breasts. From the evaluation the level set technique has proved being more effective for the images set used to testing all the methods. It has registered a higher overlap rates in relation to the image segmented by the specialist as well as low rates of under and oversegmentation, reflecting in the high accuracy and low false-positive and error rates.

SP024.6 - The Automated Marker-Free Longitudinal IR Breast Image Registration Algorithm

Author(s): <u>Chi-En Lee</u>, Chung-Ming Chen Institute of Biomedical Engineering, National Taiwan University, Taipei/TAIWAN

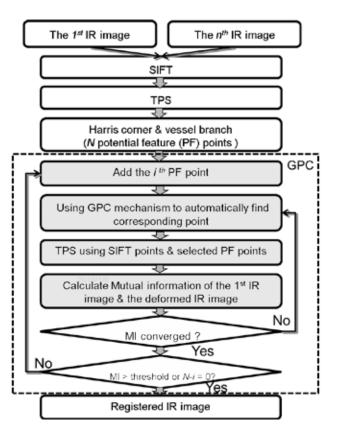

Longitudinal IR image registration is a very difficult task in general because it is impractical and unlikely to keep markers attached on a body surface of a subject for weeks or even longer. To overcome this problem, the new longitudinal IR image registration algorithm (Genetic Particle Competition, GPC), which is the first automated marker-free longitudinal IR image registration algorithm in the world for breast IR images and may be easily extended to other parts of the human body. The algorithm is based on two novel types of fiducial points, which are the corner points of heat patterns and the other is the branch points of the skeletons of heat patterns, and automated determination of corresponding pairs of fiducial points between two images. Suppose two IR images, namely, the 1st IR image and the nth IR image, are registered as depicted on the top of Fig.1. After finding the initial corresponding points by SIFT and deriving the corner points of heat patterns and the branch points of the skeletons of heat patterns, the GPC mechanism operates to find the corresponding point as follows:

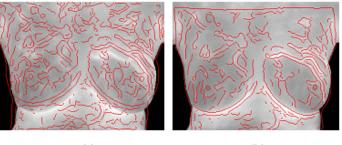

Step 1. Randomly generate a set of candidate points around the initial corresponding point, which form the competitors.

Step 2. For each of the competitors on the deformed nth IR image are calculated the mutual information (MI) between the 1st IR image. Define the competitor with the maximal MI as winner, those ranked the top 50% of MIs as the selected competitors, and replace the remaining losers by new randomly generated competitors until the MI of the winner converges.

Step 3. If MI converges, end the registration process for the nth IR image.

Fig. 2 shows the well registration results between the *1st* IR image and the *nth* IR image.

SP025 - Dose Calculation: Part 1

TRACK 04: RADIATION ONCOLOGY

SP025.1 - Theoretical ground for testing Monte Carlo transport algorithms coupled to magnetic fields

Author(s): <u>Hugo Bouchard</u>¹, Jacco De Pooter², Simon Duane¹, Alex Bielajew³

¹Radiation Dosimetry, National Physical Laboratory, London/UNIT-ED KINGDOM, ²VSL, Delft/NETHERLANDS, ³Nuclear Engineering And Radiological Sciences, University of Michigan, Ann Arbor/MI/ UNITED STATES OF AMERICA

With the advent of MRI-guided radiotherapy, radiation dosimetry in the presence of magnetic fields must be addressed in several ways to assure accurate dose delivery and patient safety. To calculate dose accurately in these conditions, the only known method capable of simulating the transport of charged particles in dense matter in the presence of magnetic fields is Monte Carlo. At the present time, general-purpose codes such as PENELOPE and GE-ANT4 already offer this option and other codes, such as EGSnrc, remain under development. To assure the accuracy of Monte Carlo results, algorithms must be tested in conditions relevant to radiation dosimetry, such as ionization chamber response to radiation dose. To achieve the same rigorous benchmark as does the Fano cavity test, it is necessary to explore the conditions under which it can be performed in the presence of a magnetic field distribution.

This theoretical study is based on Fano's approach and evaluates the possibility to achieve charged particle equilibrium in heterogeneous media having uniform atomic properties. The Boltzmann radiation transport equation, modified to include the Lorentz force, forms the basis of the theory. Two special conditions for the source and magnetic field distributions are evaluated as potential candidates for new Fano cavity tests. The applicability of Fano's theorem in these conditions is shown and the energy deposition is also derived from first principles.

Using the modified transport equation, it is demonstrated that the two proposed conditions on the source and the magnetic field allow Fano's theorem to apply. Moreover, the energy deposition under these conditions is shown to be identical to the one in the absence of magnetic field, such as in a cavity dose calculation under standard Fano conditions.

This theoretical study demonstrates two possible conditions under which Fano's theorem is applicable in the presence of a magnetic field. While it was previously shown that in general, Fano's theorem cannot hold in the presence of a uniform magnetic field as it does not scale with mass density, this study is a significant improvement towards benchmarking Monte Carlo codes coupling radiation transport with magnetic fields.

SP025.2 - Primary X-ray source spot size modeling for FFF photon beam in VMAT based Stereotactic Radiosurgery – A comparative clinical study using Acuros-XB and AAA dose calculation algorithm

Author(s): <u>Vellian Subramani</u>¹, Murugesan Kathirvel², Gandhi Arun², Shanmugam Thirumalai Swamy³, V.S Subramanian² ¹Radiation Oncology, All India Institute of Medical Sciences, New Delhi/INDIA, ²Research And Development Centre, Bharathiar University, Coimbatore/INDIA, ³Radiation Oncology, YASHODA HOSPITAL, HYDERABAD/INDIA

Aim: Purpose of this study is to find out the appropriate Flatten-

ing Filter Free (FFF) photon beam primary source size for beam modeling in treatment planning system of VMAT based Stereotactic Radiosurgery using Acuros-XB and Analytical Anisotropic Algorithm (AAA) dose calculation algorithm.

Material and Methods: Recently our Clinac-2100CD Varian linear accelerator was upgraded to high dose rate Flattening Filter Free (FFF) 6MV X-rays for Stereotactic Radiosurgery. Beam parameters measured from minimum 2x2cm² to 40x40cm² field. As VMAT/IMRT based Stereotactic Radiosurgery comprises of many small segments, Penumbra modeling play a major role in final dose calculation. Both AAA & Acuros-XB algorithms allow users to fine tune the primary source spot size(SSS) so that computed beam profile penumbra can match with the measured beam penumbra for all the field sizes. SSS were varied from 0 to 2mm in steps of 0.5mm in X&Y direction. For each SSS, dose was calculated for open field sizes of 3x3cm², 5x5cm² & 10x10cm² and was analyzed with measured beam parameters. To evaluate beam modeling a water phantom (size=40x40x40cm³) was created and dose was calculated for different fields & for different SSS. The profiles at dmax and 10cms depth were taken for penumbra analysis with respect to measured profile. For all the SSS & field sizes Distance (in millimeters) to agreement (DTA) were performed between computed & measured 80% and 20% dose point left & right of the central axis (Inflection point method were also utilized). Clinical impact on VMAT based stereotactic treatment analyzed dosimetrically for both algorithms using different SSS beam modeling.

Results: For AAA algorithm, the average DTA at Dmax for SSS of 0, 0.5, 1.0, 1.5, 2.0mm were -0.72±0.57, -0.72±0.57, -0.46±0.56, 0.09±0.40, -0.22±0.42 mm respectively. The average DTA at D10 for SSS of 0, 0.5, 1, 1.5, 2.0 mm were -0.74±0.73, -0.74±0.73, -0.57±0.67, -0.03±0.64, 0.08 ±0.63 mm respectively. Similarly for Acuros-XB algorithm the average DTA at Dmax for SSS of 0, 0.5, 1, 1.5, 2.0 mm were -0.71±0.59,-0.71±0.59, 0.20±0.28, 0.34±0.31, and 0.62±0.38 mm respectively. The average DTA at D10 for SSS of 0, 0.5, 1, 1.5, 2.0mm were -0.52±0.65, -0.52±0.65, -0.15±0.75, -0.09±0.78, 0.11±0.79 mm respectively. Stereotactic treatment plan analysis shows that average PTV mean dose variation with SSS 0.75mm for AAA was found -2.0% compared to 1.0mm default SSS, whereas Acuros-XB SSS 1.2mm variation -1.2% compared to default 1.0mm. Absolute dose measurement results using small volume ion chamber and predicted plan dose variation for VMAT stereotactic plans found very minimal with AAA SSS 0.75mm and Acuros-XB SSS 1.2mm compared to algorithm default SSS.

Conclusion: For AAA algorithm the results shows a good agreement between measured dose and calculated dose for spot sizes of 0.5-1mm. On the other hand for Acuros-XB algorithm, a spot size of 0.5-1mm agrees better for the field size up to 5x5cm² & a spot size of 1-1.5mm agrees better for the field size greater than 5x5cm². Algorithms showed good agreement with measurement for range of fields provided primary source spot configuration has been adequately tuned for precise dose calculation and delivery.

SP025.3 - A Geant4 Helical Tomotherapy model as a tool for 3D dose distribution evaluation

Author(s): <u>Alessandro Esposito</u>¹, Barbara Caccia², Elisabetta Cagni³, Emilio Mezzenga³, Mauro Iori³

¹INESC TEC, Porto/PORTUGAL, ²Technology And Health Department, Istituto Superiore di Sanità, Rome/ITALY, ³Medical Physics Unit, Irccs, Arcispedale Santa Maria Nuova, Reggio Emilia/ITALY

Very high technological level is involved in Helical Tomotherapy (HT). The gantry rotation, couch speed, dose rate and accurate MLC leaf positioning are crucial for accurate dose delivery. For a high quality and safe treatment, a machine Quality Assurance (QA) program and patient-specific dose verifications are requested. The most detailed

and complete description of radiation-matter interaction is taken into account by Monte Carlo (MC) method. Therefore, this approach has become a key issue in patient-specific dose verifications.

In this work, a complete and detailed numerical MC model of a HT unit is developed and commissioned on the basis of experimental data, in order to apply it to QA and treatment plan dose check. The full structure of the simulated HT unit is presented in Figure 1 in both longitudinal and transversal view. After commissioning, the capability of the model unit to well reproduce (or verify) some QA and patients plans has been tested through comparison with the HT treatment planning system (TPS) in terms of 3D dose distribution for a treatment plan on water equivalent specific phantom. In Figure 2 the comparison between HT-TPS and GEANT4 MC calculated dose distributions is shown in transversal view.

The reliability of the simulated system is proven by the very good agreement between simulated and experimental PDD and dose profiles in commissioning. A gamma function test has been applied to the whole data set obtaining 97.5% of gamma point to be less than unity using 2mm and 2% as gamma criteria.

Furthermore, the application can be considered a solid tool to implement and evaluate a patient-specific dose QA for the HT plans given the perfect agreement with the HT-TPS shown by dose profiles in the calculated 3D dose distribution of the treatment plan in water equivalent phantom.

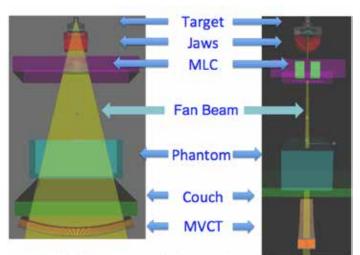

Figure 1. Model of the helical tomotherapy unit (a) in the two sides (longitudinal and transversal)

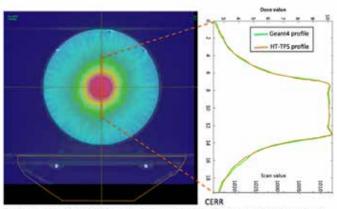

Figure 2 - Comparison of dose distribution obtained by Geant4 simulation with the HT-TPS calculation on cheese phantom in transversal view

SP025.4 - Development of 4D actual delivered dose calculation system for dynamic tumor-tracking irradiation with a gimbaled linac

Author(s): <u>Yoshitomo Ishihara</u>¹, Akira Sawada², Nami Ueki¹, Nobutaka Mukumoto¹, Mitsuhiro Nakamura¹, Yuki Miyabe¹, Yukinori Matsuo¹, Takashi Mizowaki¹, Masaki Kokubo³, Masahiro Hiraoka¹ ¹Department Of Radiation Oncology And Image-applied Therapy, Kyoto University Graduate School of Medicine, Kyoto/JAPAN, ²Faculty Of Medical Science, Kyoto College of Medical Science, Kyoto/ JAPAN, ³Department Of Radiation Oncology, Kobe City Medical Center General Hospital, Kobe/JAPAN

(1) Purpose

In previous works, we have developed an in-house integrated fourdimensional (4D) Monte Carlo (MC) dose calculation system as a routine verification tool for dynamic tumor-tracking (DTT) irradiation. The purpose of this study was to develop 4D actual delivered dose calculation system for DTT irradiation by gimbals mechanism with Vero4DRT.

(2) Method

First, plans were created for five patients having lung cancers under the normal protocol for DTT. Furthermore, the modified DTT plans were created in consideration of several errors such as intrafractional mechanical, positional predictive, and overall targeting errors during DTT irradiation. These errors were retrospectively computed from orthogonal fluoroscopy images and the system log files stored during DTT irradiation. Subsequently, 4D MC dose calculation was performed with 6-MV photon beam delivered by the Vero4DRT using EGSnrc for both the original and the modified DTT plans, respectively. At that time, phase-space data at each respiratory phase was created from the particle data under the MLC with or without the above errors, respectively. Next, 4D dose distribution was created by summing up the dose distribution under the geometrical combination of the target and the MV beam at each respiratory phase. The dose distribution computed with the above errors was regarded as the delivered dose distribution during DTT irradiation while the dose distribution computed without the above errors was regarded as the planned DTT dose distribution. Finally, isodose curves and DVHs were compared between the planned DTT and the delivered DTT dose distribution.

(3)Result

For all cases, 2D gamma passing rate was 93% using criteria of 2% / 2 mm for each dose distribution on the axial, sagittal, and coronal planes at the isocenter, respectively. CTV coverage, mean dose within the lung, and maximum dose within the spinal cord were comparable between the delivered DTT and the planned DTT dose distribution.

(4) Conclusion

We have developed 4D actual delivered dose calculation system for DTT irradiation using the gimbaled x-ray head. The result has demonstrated that DTT irradiation with Vero4DRT achieves the dose delivery with high accuracy.

SP025.5 - Organ Doses from Hepatic Radioembolization with Y-90, Sm-153, Ho-166 and Lu-177: A GEANT4 Monte Carlo Simulation Study

Author(s): Nurul A.A. Hashikin¹, <u>Chai Hong Yeong</u>¹, Susanna Guatelli², Basri Johan Jeet Abdullah¹, Kwan Hoong Ng¹, Alessandra Malaroda², Anatoly Rozenfeld²

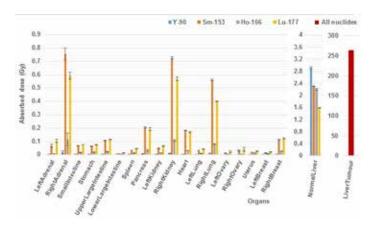

¹Department Of Biomedical Imaging, Faculty Of Medicine, University of Malaya, Kuala Lumpur/MALAYSIA, ²Centre For Medical Radiation Physics, Faculty Of Engineering And Information Sciences, Univer-

sity of Wollongong, Wollongong/NSW/AUSTRALIA

Introduction— Y-90 radioembolization are increasingly used for palliative treatment of advanced liver cancer. Since its physical decay is fully via beta emission, imaging following the treatment is rather challenging. Radionuclides with both beta and gamma emissions have been explored as alternative to Y-90 in liver radioembolization, however little information was available in terms of internal radiation dosimetry.

Materials & Methods- Monte Carlo simulation using GEANT4 source code was carried out. The GEANT4 advanced example human_phantom was used. A mathematical female phantom was adopted with organ geometries as specified in MIRD Pamphlet 5. A medium size, spherical hepatic tumor with radius, r = 4.3 cm was modelled within the liver volume. Y-90 sources were isotropically distributed within the tumor with total activity of 1.82 GBq determined using Body Surface Area (BSA) method recommended by SIRTex (Sydney, Australia) for the Y-90 therapy. The dose was calculated in all the organs of the human phantom. The simulation was carried out with the assumption of no lung and extrahepatic shunting, with full localization of Y-90 sources within the tumor volume. The resulting tumor dose was validated by comparing it with the dose calculated using partition model. The simulation study was repeated substituting Y-90 with Sm-153, Ho-166 and Lu-177. GEANT4.9.6.p03 was used.

Results— The 333 cm³ tumor volume corresponded to 18% tumor involvement. The tumor and normal liver tissue doses for the Y-90 simulation were (262.9 ± 0.6) Gy and (2.9 ± 0.1) Gy, respectively. In order to deliver tumor dose equivalent to 1.82 GBq Y-90, approximately 8.32, 5.83, and 4.44 GBq were required for Sm-153, Ho-166 and Lu-177, respectively. Doses to other organs were mainly dependent on the gamma energies (Figure 1). All the organ doses did not exceed 1 Gy.

Discussions— Although the organ doses deriving by Sm-153 and Lu-177 were relatively higher compared to Ho-166 and Y-90, the doses were still far below the maximum tolerance limit commonly used in radiotherapy, i.e. 60, 23 and 17.5 Gy for adrenal glands, kidneys and lungs, respectively. Alternative treatment with Sm-153 or Lu-177 is still feasible as long as the organ tolerance limit were not exceeded.

Conclusion—Ho-166, Lu-177 and Sm-153 offer the advantage of emitting useful gammas for post-procedure imaging. They show potentials as Y-90 substitutes for liver radioembolization, delivering a comparable tumor dose, and doses within the maximum tolerance limit to the surrounding organs.

SP025.6 - Stereotactic Ablative Radiotherapy (SABR) for lung cancer using Volumetric Modulated Arc Therapy (VMAT) with a 10x Flattening Filter Free (FFF) beam: validation of the calculated dose distribution using Monte Carlo

Author(s): <u>Tony Mestrovic</u>, Matthew Murray, Reid Townson, Sergei Zavgorodni

Medical Physics, BC Cancer Agency, Victoria/BC/CANADA

Introduction:

The use of 10xFFF beams for lung SABR treatments has been gaining popularity in the recent years due to the high dose rates (up to 2400 MU/min). The tissue/lung interface in and around the Planning Target Volume (PTV) presents a challenge for dose calculation algorithms to accurately predict the dose to the PTV for 10xFFF beams.

Purpose:

The purpose of this study was to compare the calculated dose distributions using Analytical Anisotropic Algorithm (AAA) and AcurosXB Algorithm in Eclipse[™] (Varian) to Monte Carlo (MC) generated dose distributions for 10xFFF VMAT lung SABR treatments.

Method/Materials:

Thirteen lung SABR patients were used in this study with varying PTV locations and sizes (7cc-141cc). Both AAA and AcurosXB were used to calculate the dose distributions for the same treatment plan in Eclipse. The MC system used in this study employed BeamNRC and DoseXYZ codes. The modeling of the MLC leaves was done using the dynamicVarian MLC (DYNVMLC) model. For each patient, the MC system was used to calculate the dose distribution for the same treatment plan that was used in Eclipse. The MC calculated dose was compared to AAA and AcurosXB calculated doses, in terms of: 1) volume of the PTV receiving the prescribed dose (48Gy/4); and 2) PTV mean dose.

Results:

Generally, the dose distributions calculated with AAA and AcurosXB algorithms differed significantly in the peripheral parts of the PTV, near the lung/tissue interface (figure 1). Figure 2 displays the PTV V48Gy and the PTV mean dose for AAA, AcurosXB and MC. The AAA over-estimated the PTV coverage, especially for smaller PTVs. The AcurosXB algorithm showed a significantly better agreement with MC compared to AAA.

Conclusions:

The AcurosXB algorithm agrees significantly better with MC compared to AAA, and therefore it should be used for 10xFFF VMAT lung SABR treatments.

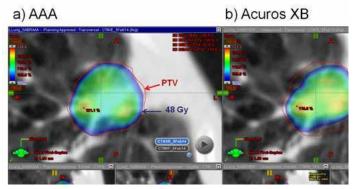

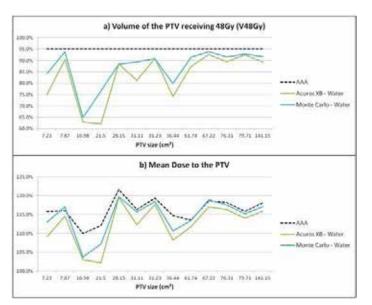

Figure 1

SP025.7 - Performance of the ACUROS [™] dose calculation algorithm for 6 MV FFF beams in inhomogeneous media Author(s): <u>Matthew Schmid</u>¹, Tony Teke²

¹BC Cancer Agency- Centre for Southern Interior, Kelowna/BC/ CANADA, ²BC Cancer Agency- Centre for Southern Interior, Kelowna/CANADA

Purpose:

FFF beams are now commonly used in radiation therapy treatment. Because of the high dose rate that these beams typically offer, they are often used for stereotactic body radiotherapy (SBRT) of the lung. Accurate dose calculations are particularly important in these cases due to the high fractional doses delivered. In this study, the accuracy of Varian's Acuros XB dose calculation algorithm is investigated in inhomogeneous phantoms for both open fields and VMAT treatments.

Methods:

Three series of tests were performed using three different phantoms. ACUROS calculated doses were compared to Monte Carlo (MC) calculations, the anisotropic analytical algorithm (AAA), and film measurements. The phantoms were comprised of water equivalent material, lung equivalent material, and bone equivalent material. In one series of tests, the doses at various depths in slabs of lung and bone material embedded in solid water were evaluated. A second series of tests evaluated the 2D dose distribution in planes containing inhomogeneity boundaries, and a third set of tests used the QUASAR[™] phantom (Modus Medical Device Inc.).

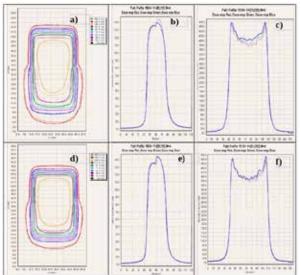

Results:

The depth-dose calculations in a slab of lung material embedded in solid water showed good agreement between the Acuros XB, MC, AAA, and measured values. The calculated depth dose values in a slab of bone embedded in solid water calculated by AAA agreed well with the measured values. Acuros calculated depth doses to medium showed excellent agreement with Monte Carlo calculations (dose to medium) and good agreement with film measurement, but differences above 5% were found in the calculation of dose to water with measurements. Monte Carlo calculations were repeated with the Gafchromic film simulated by a thin layer of water and showed excellent agreement with measurements. The 2D dose distributions calculated using the Acuros XB algorithm showed substantially bet-

ter agreement with measurement than the AAA calculations (Figure 1 a,b,d and e). This was also true for the dose calculations in the lung phantom and for VMAT plans on the QUASAR phantom (Figure 1 c and f).

Conclusions:

The Acuros XB algorithm performs well for calculating doses for 6 MV FFF beams in and around lung-like inhomogeneities, and shows better agreement with measurements than the AAA algorithm. In bone-like material, it shows good agreement in calculating the dose to medium, but differences above 5% were found in the calculation of dose to water.

SP025.8 - Ray Tracing Algorithm for Virtual Source Modelling based on Evaluation of Rounded Leaf End Effect of Multileaf Collimator

Author(s): Dong Zhou, Hui Zhang, Peiqing Ye

Department Of Mechanical Engineering, Tsinghua University, Beijing/CHINA

Rounded leaf end effect of multileaf collimator plays a role in penumbra characteristics of dose profile. It strongly influences dose target volume conformity and organ at risk sparing for radiation therapy. Previous studies have shown that parameters in virtual source model could be fitted using dose distribution results obtained from Monte Carlo simulation or dosimetric measurement. However, there is a lack of research in literature reporting on virtual source modeling with the rounded leaf end effect incorporated. In this study, we present an analytical method for virtual source modeling by evaluation of the rounded leaf end effect of multileaf collimator on dose profile. We confine our study to single source modeling, with source energy distribution of Gaussian shaped. Ray Tracing algorithm is introduced and parameter estimation is conducted to revise the source size. Model verification is performed with numerical simulation, which is conducted based on the Monte Carlo codes of EGSnrc/BEAMnrc. It is shown that Ray Tracing algorithm employing the focal spot size of photon source would result in reduced penumbra width, compared with the simulation counterpart. This observation is probably related to the aperture effect of multileaf collimator. In contrast, results of penumbra width and radiation field edge offset using revised source size obtained with parameter estimation agree well with Monte Carlo simulation. In summary, the method we propose could provide insight into virtual source modeling using Ray Tracing algorithm.

SP026 - Reference Dosimetry - Developments and Monitoring

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP026.1 - The Development of a Device for the Fricke Dosimetry for HDR Brachytherapy

Author(s): <u>Camila Salata</u>, Mariano G. David, Carlos E. Dealmeida Dbb, Universidade do Estado do Rio de Janeiro, Rio de Janeiro/ BRAZIL

HDR-BT is considered an important option for cancer treatment, but the calibration of the Ir-192 is complex. The Fricke dosimetry has been considered an option to determine the absolute absorbed dose to water. It is composed mainly of water and ferrous sulfate, and the ferric ions in the solution will be converted to ferrous ions by the ionizing radiation, proportionally to the absorbed dose into the solution. The optical density of the solution is measured using a spectrophotometer. As this is a liquid dosimeter it is important to have a device where the solution will be irradiated. Some characteristics of the device should be considered: the wall material should be water equivalent and shouldn't react with the solution; it must be sealed, but easy to vert the solution from the vessel into a cuvette to read it with the spectrophotometer. The main purpose of this study was to develop a device for the irradiation of the Fricke solution, using the HDR-BT Ir-192 sources.

Figure 1: Evolution of the devices created for the Fricke Dosimetry.

The first device created (Figure 1A) consisted of two glass balloons, one inside the other. The solution was disposed in the space between the balloons. The source was positioned in the center, inside a glass tube so it didn't have any contact with the solution. Some measurements were done, and the disadvantages of this device were: the glass material wasn't water equivalent; and the solution wasn't homogeneously irradiated, as the distance from the source wasn't the same on all the irradiated solution. The device was redesigned to improve the measurements (Figure 1B). The main changes were: the wall material was water equivalent, PMMA; the solution volume irradiated was only a central ring, so the solution was homogeneously irradiated. More measurements were done and it was very difficult to fill the device with the solution, and also difficult to vert the solution to the cuvette. The current device (Figure 1C) is a cylinder ring, where the solution is disposed and have corrected those problems. The source position is now calculated to be at the center of the ring. Now it is easier to fill it with the solution, and to vert the solution to the cuvette. Those improvements of the device are very important to the development of the Fricke dosimetry as an option for the Ir-192 sources calibration.

SP026.2 - A New Methodology for the Determination of the G-value for Fricke Dosimetry

Author(s): <u>Camila Salata</u>¹, Leo D.O. Franco², Mariano G. David¹, Carlos E. Dealmeida¹

¹Dbb, Universidade do Estado do Rio de Janeiro, Rio de Janeiro/ BRAZIL, ²Dbb, UERJ, Rio de Janeiro/BRAZIL

The Fricke dosimeter is a chemical dosimeter and its base is the ferrous sulfate. It is one the most widely used chemical dosimeters and has been considered as a possible dosimeter for the determination of the primary standard for the absorbed dose to water of Ir-192 High Dose Rate brachytherapy (HDR-BT) sources. The Fricke dosimeter is mainly composed of water, so its attenuation of radiation is very similar to the water, which turns possible its use as an absolute dosimeter. During the interaction of the radiation with the Fricke solution the ions Fe⁺² are converted in Fe⁺³, and this conversion is proportional the absorbed dose at the solution. One of the parameters used to determine the absorbed dose at the Fricke solution is the chemical yield, known as the G-value. The G-value can be defined as the number of molecules of Fe⁺³ produced per Joule of energy absorbed in the solution. This parameter has been determined by different authors, for different energies, but those data are old, and the methodology used was based on interpolations. This study proposes a new methodology for the determination of the Gvalue for Ir-192 HDR-BT sources. On the methodology proposed it was used a PMMA phantom (figure 1A) filled with water with three supports of PMMA for the Fricke solution, one for the ion chamber, and one for the Ir-192 source in the center (figure 1B).

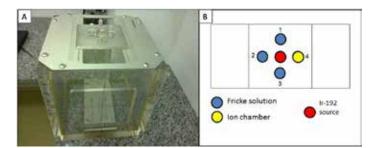

Figure 1: A) PMMA Phantom with the supports for Fricke solution, ion chamber and Ir-192 source. B) The positioning of the supports in detail.

The position of the supports were fixed for each irradiation, and changed clockwise direction, after each irradiation. The source was always fixed in the center of the support. After each irradiation the optical density of the solution was read using a Micronal spectrophotometer. The absorbed dose in the Fricke solution at each position was considered equal to the dose determined by the ion chamber on the same position, the *G-value* was determined for each position. The mean *G-value* found was 1.5786 x 10⁻⁶ ± 0.014 µmol.J⁻¹ (*k*=1), which is consistent with the data in the literature. The main advantage of this proposed method is that the *G-value* is measured using the Ir-192 source directly, and not interpolations. Those results will be repeated using a new spectrophotometer recently acquired by the LCR, with better resolution and sensibility. This will improve the uncertainties associated with the measurements.

SP026.3 - The Use of Fricke Dosimetry as a Primary Standard for the Absorbed Dose to Water for 192Ir HDR-BT Sources: Determination of the G-value

Author(s): <u>Camila Salata</u>¹, Mariano G. David¹, Paulo H. Rosado², Islam El Gamal³, Ernesto Mainegra-Hing⁴, Claudiu Cojocaru⁴

¹Dbb, Universidade do Estado do Rio de Janeiro, Rio de Janeiro/BRA-ZIL, ²Dbb, UERJ, Rio de Janeiro/BRAZIL, ³National Research Council, Ottawa/ON/CANADA, ⁴National Research Council, Ottawa/CANADA

High dose rate brachytherapy (HDR-BT) using ¹⁹²Ir sources is well accepted as an important treatment option and thus requires an accurate dosimetry standard. However, a dosimetry standard for the direct measurement of the absolute dose to water for this particular source type is currently not available. The Fricke dosimetry is being considered an option as a primary standard for the dose to water for ¹⁹²Ir sources.This dosimetry technique depends on the oxidation of ferrous ions (Fe²⁺) to ferric ions (Fe³⁺) by ionizing radiation. The increased concentration of ferric ions is measured spectrophotometrically at 304 nm. For the determination of the absorbed dose to water, using Fricke dosimetry, it's first necessary to determine the absorbed dose in the Fricke solution. For this purpose some parameters are needed: the difference of the optical density between the control and the irradiated solutions; the pathlength of the cuvette; the density of the solution; the molar linear absorption coefficient of the ferric ions; and the radiation chemical yield of ferric ions, also known as the G-value. Among those parameters the G-value is one of major concern, as the few literature data on its determination for the¹⁹²Ir energy range are old, with large uncertainties and not well described. Previous studies showed different methods for the G-value determination: ionometric and calorimetric measurements; estimation of the energy-weighted G value from published values, using interpolation; empirically, calculating from empirical equations the radiation yields of the primary products due to solution radiolysis; among others. The National Research Council Canada (NRC) developed a promising new method for the G-value determination, using the Fricke solution. In this study the NRC method was reproduced at the Radiological Sciences Laboratory (LCR), in Rio de Janeiro/ Brazil. Briefly, this method consists of interpolating the G-values calculated for 60Co and 250 kV x-rays for the average energy of 192 Ir (380 keV). The G-value for 60Co is calculated using the dose to water determined by a calibrated ion chamber, and making it equivalent of the dose to water in the Fricke solution, also using Monte Carlo calculated factors for this conversion. The same procedure is done for the 250 kV x-rays energy, but the quantity measured with the ion chamber is the air kerma. For the irradiations with the Fricke solution, the NRC developed a device where the polyethylene bags filled with Frick were later disposed. The irradiations and measurements of this present study were performed at the Brazilian National Laboratory. The result found for the G-value for 380 keV is 1.540 μ mol/J \pm 1.0 %. It's important to highlight that this value is different from the ones reported in the literature by at most 3%. For this reason more measurements will be done to confirm this result.

SP026.4 - IAEA Dosimetry Laboratory support to the IAEA/ WHO SSDL Network

Author(s): Igor Gomola, Istvan Csete, Ladislav Czap, Joanna Izewska, Ahmed Meghzifene Nuclear Sciences And Applications, International Atomic Energy Agency, Vienna/AUSTRIA

The IAEA Dosimetry Laboratory (DOL) is the central laboratory of the IAEA/WHO Network of Secondary Standards Dosimetry Laboratories (SSDLs). In 1976, the IAEA in collaboration with the WHO established this Network to provide a forum in which national SSDLs could regularly perform measurement comparisons and thus strengthen confidence in radiation dosimetry coherence worldwide. This Network, through its 84 SSDL members designated by Member States, provides a framework to establish a direct linkage of national dosimetry standards to the international measurement system (SI) of standards and the dissemination of SI quantities and units to end users through the proper calibration of field instruments by the SSDLs.

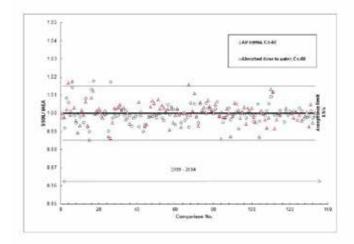

A Quality Management System (QMS) has been established for the DOL following the guidelines of EN ISO/IEC 17025:2005 standard. In 2005, the Joint Committee of the Regional Metrology Organizations (JCRB) and the Bureau International des Poids et Measures (BIPM)

formally acknowledged that the DOL QMS satisfies the requirements of the Mutual Recognition Arrangement established by the Committee for Weights and Measures (CIPM-MRA). Since that time, the 23 different calibration capabilities of the DOL are peer reviewed regularly; they are internationally accepted, and published in the frame of the CIPM-MRA.

The activities of the IAEA include an inter-laboratory comparison programme (for air kerma, Kair, and absorbed dose to water, Dw, in Co-60 beam, and Kair for diagnostic X-ray beam qualities) that enables the participating SSDLs to harmonize their calibration practices for measuring instruments used for the determination of different dosimetry quantities in line with the IAEA Codes of Practice TRS-398 and TRS-457. (*Figure 2. shows the results for Kair* and Dw in Co-60 beam)

In addition, the IAEA offers training opportunities in radiation dosimetry, calibration of dosimetry standards dosimetry audits, and quality management for SSDL staff from Member States. The training of SSDL staff contributes to the improvement of measurement capabilities in radiation dosimetry for radiation therapy, diagnostic radiology and radiation protection applications of ionizing radiation in IAEA Member States.

Figure 1. Results of SSDLs in the ongoing therapy level comparison program using participants` transfer chambers. (*Participant gets further assistance to perform corrective action(s) if its result is out of the acceptance limit.*)

SP026.5 - Measurement of Wair in high energy electron beams Author(s): <u>Claudiu D. Cojocaru</u>, Malcolm R. Mcewen, Carl K. Ross Ionizing Radiation Standards, National Research Council Canada, Ottawa/ON/CANADA

lonization chambers are widely used for measuring radiation fields. In the majority of cases, an ion chamber is used as a secondary device (with a calibration against a primary standard of air kerma or absorbed dose) or in a purely relative way (determination of output factors, beam commissioning, *etc*). For absolute measurements, as in the primary determination of air kerma, a conversion factor is required - *Wair*, the mean energy expended by an energetic electron to create an ion pair in the air of the chamber cavity. A consensus value exists for *Wair* ⁶⁰Co γrays, based mainly on comparing the response of a graphite calorimeter with that of a graphite ionization chamber. At higher electron energies (> 5 MeV) the graphite/air stopping power ratio (required to obtain *Wair*) is less dependent on input data such as the mean excitation energy and therefore measurements in the energy range from 5 MeV to 30 MeV will provide independent information on both the absolute value of *Wair* and its variation with energy.

The Vickers research linac at the National Research Council Canada was used to produce broad beams of electrons with incident energies of 20 MeV and 35 MeV. The ratio of the response of a graphite calorimeter to that of a graphite-walled cavity ionization chamber (with a well-known measuring volume) was determined for each beam. The measurement depth in graphite was varied to yield different mean electron energies at the measurement point and to test the systematics of the measurement procedure (particularly the calorimeter response). The material properties and the geometries were well known and the two devices were well characterized before their use in the experiment. Using the EGSnrc Monte Carlo and its associated user codes, as well as the best available stopping power data for graphite, we calculate the perturbation effects due to the calorimeter and ionization chamber and the effect of extrapolating from scattered to plane-parallel beams. We also used finite element software to model the thermal response of the calorimeter and determine correction factors for heat conduction.

For a single incident energy there was very good consistency for different measurement depths (standard uncertainty ~ 0.2 %) which indicates that there are no significant systematic errors in the measurement procedure or in the determination of correction factors. However, a difference of 1 % was observed between the mean values for *W*air obtained in the 20 MeV and 35 MeV electron beams. An initial analysis has not indicated a problem with either set of measurements but a calorimeter with a revised design is under construction to further test some of the heat conduction issues, which contribute the largest correction factor. Taking all the measurements obtained as a single data set we arrive at a mean value of *W*air = (34.00 ± 0.15) eV. This value agrees within the overall uncertainties with both the ⁶⁰Co consensus value and electron beams measurements carried out at the US National Institute of Standards and Technology.

SP026.6 - Monte Carlo corrections for a Fricke-based standard of absorbed dose to water for Ir-192 HDR brachytherapy. Author(s): Ernesto Mainegra-Hing

Measuring Science And Standards, National Research Council of Canada, Ottawa/CANADA

Purpose: Ir-192 HDR Fricke dosimetry requires a conversion factor dose to Fricke to air-kerma to determine the G-value of a 250 kV x-ray beam, and several correction factors to obtain the dose to water at the reference position. These factors can be determined using Monte Carlo (MC) techniques.

Methods: The G-value for an Ir-192 source is determined by interpolation between the G-values of two known beam qualities, Co-60 and 250 kV x-rays. The G-value of the 250 kV x-ray beam is determined by irradiating a bag with Fricke solution of known volume with a 250 kV beam of known air-kerma. A conversion factor dose to Fricke to air-kerma, DF/Kair, is calculated using the EGSnrc user-code cavity combined with a BEAMnrc model of the x-ray source. Knowledge of the Ir-192 G-value makes it possible to measure the dose imparted to a Fricke dosimeter placed at the reference position, immersed in a water phantom. The dose to water at the reference position is derived from the dose to Fricke by applying a conversion to dose to water, f^wF, and several corrections to remove the effects of the holder, catheter, and beaker materials (Pwall), and to correct for volume averaging (Kdd). These corrections are determined with the EGSnrc user-code cavity by modeling the microSelectron V2 Ir-192 HDR seed used in our lab and the measuring setup in detail.

Results: DF/Kair is the largest factor required, with a value of 1.15 [0.06%]. This large value can be explained mostly by the mass

energy absorption coefficient ratio Fricke to air which is about 1.11 [0.02%] as determined using the EGSnrc user-code g. An Awall calculation with the user-code cavity shows that the rest of this conversion factor is due to the contribution from secondary particles to the dose to Fricke (Awall=1.036 [0.002%]). Volume averaging contributes the second largest correction, which is about 1.015, while the wall correction and the Fricke to water conversion factor almost cancel out.

Conclusions: MC simulation can be used to determine the corrections required for HDR Fricke dosimetry. The large value of the Fricke to air-kerma conversion factor can be explained by the difference between the mass energy absorption coefficients for the Fricke solution and air. Remaining differences are caused by the contribution from secondary particles. The factor needed to obtain dose to water at the reference position from the dose to a Fricke dosimeter is significantly smaller and mainly due to volume averaging. Future work will focus on the sensitivity of these corrections to systematic uncertainties in the cross sections used for the MC calculations.

SP026.7 - Changes in absorbed dose to water caused by dose standard shift for ionization chamber calibration in Japan Author(s): <u>Hidetoshi Saitoh</u>¹, Toru Kawachi², Morihito Shimizu³ ¹Graduate School Of Human Health Sciences, Tokyo Metropolitan University, Tokyo/JAPAN, ²Chiba Cancer Center, Chiba/JAPAN, ³National Institute of Advanced Industrial Science and Technology (AIST), Tsukuba/JAPAN

Introduction

The standard of absorbed dose to water in 60Co y rays was established at the National Metrology Institute of Japan (NMIJ) in 2011. Subsequently, ionization chamber calibration service has been provided by the Association for Nuclear Technology in Medicine (ANTM) as a secondary standard dosimetry laboratory and new standard dosimetry protocol by the Japan Society of Medical Physics (JSMP12) has been proposed in 2012. Until 2012, product of the 60Co exposure calibration factor NC and the exposure to absorbed dose conversion coefficient kD,X was substituted for the absorbed dose to water calibration factor ND.w. although previous dosimetry protocol (JSMP01) was based on the IAEA TRS-398. The kD,X was computed using nominal chamber structure and not individual structure. However, ND,w has been computed for individual ionization chamber directly. Accordingly, it was forecasted that uncertainty of absorbed dose to water evaluated by individual user has been reduced by adoption of the ND,w and JSMP12. The third party evaluation of absorbed dose to water has been performed since 2007. In this report, the changes in absorbed dose to water evaluated by the user facilities between the JSMP 01 and 12 is reported.

Method

The third party evaluation of absorbed dose to water has been performed between the Tokyo metropolitan hospitals and the Tokyo metropolitan university (TMU) since 2007. In order to investigate the changes between the JSMP01 and 12, the absorbed dose at calibration depth *D*c was evaluated. Absorbed dose measurement was performed separately by the stuff of the facilities and the TMU on the same day. Ionization chamber (TN30013, PTW), electrometer (Inovision 35040), digital quartz barometer (745-16B, Paroscientific), digital thermometer (TL1-A, Thermoprobe) and 1D water phantom (WP1D, IBA) was used for the third party evaluation and own equipment was used for the user evaluation.

Results

Before 2011, mean deviation from Dc evaluated by TMU and its standard deviation (1 σ) were from 0.5 % to 0.7 % and from 0.5 %

to 0.7 %, respectively. By the investigation in 2013-2014, *ND*,w and JSMP12 was adopted in 7 of 11 facilities. By analysis using the result of 7 facilities, mean deviation and its standard deviation was reduced to 0 % and 0.4 %, respectively. As a result, there is significant difference in mean deviation and variance (p < 0.05) between JSMP01 and 12.

Conclusion

In this report, it was observed that the deviation and variance between user and third party evaluation of *D*c was reduced. Therefore it is confirmed that uncertainty of absorbed dose to water evaluation is reduced by adoption of the*N*D,w calibration and the new dosimetry protocol JSMP12.

SP026.8 - A calibration system of therapy-level dosimeter in Japan organized by ANTM

Author(s): Suoh Sakata¹, Wataru Yamashita¹, Nobuhiro Takase¹, Masahiro Hoteida¹, Yosuke Sasaki¹, Hiroaki Okumura¹, Hideyuki Mizuno², Katuhisa Narita¹, Akifumi Fukumura²

¹Dose Calibration Center, The Association for Nuclear Technology in Medicine, Chibashi/JAPAN, ²Research Center For Charged Partile Therapay, National Institute of Radiological Sciences, Chibashi/ JAPAN

In Japan, the therapy-level dosimeter calibration had been carried out in terms of exposure until 2012. Therefore, the conversion factor kD,X was necessary to convert the calibration factor Nx obtained in air measurement to the water absorbed dose calibration factor ND,w. In 2011, Japanese National Standard Laboratory (National Metrology Institute of Japan, NMIJ) established the national measurement standard of therapy level absorbed dose to water of Co60 and started to deliver this standard. According to the NMIJ activity, the ANTM (Association for Nuclear Technology in Medicine, the SSDL in Japan) has launched a new dosimeter calibration system in terms of absorbed dose to water from October 2012, too. After that, ND,w determined directly in water is delivered to radiotherapy institutions in substitution Nx.

The calibration procedure by ANTM follows Standard Dosimetry 12 published by Japan Society of Medical Physics (JSMP). The concept and formalism of Standard Dosimetry are almost same to IAEA TRS 398. Ionization chambers to be calibrated are fixed at 5cm depth in water phantom. For cylindrical type chambers, appropriate waterproof sleeves are used not only to protect water but also to fix their position in the phantom. The sleeves are made of PMMA with a wall of 1mm in thickness at ionization effective volume of chamber. For flat type chambers that are water proof or have water proof cap are put into water directly.

ANTM is a calibration laboratory certified with the Japan Calibration Service System (JCSS) and can issues certificate with JCSS symbol mark. The JCSS is a standard dissemination system based on Metrological Law. The principles of JCSS are the calibration traceable to national standard and the certification of calibration laboratory. Calibration laboratories certified are proven to have sufficient technical and management competence to carry out calibration. Calibration certificate issued with JCSS synbol mark states both calibration value traceable to the national standard and its uncertainty. Users who use dosimeters calibrated can estimate the uncertainty of their own dose measurements.

During 27 months from October 2012 to December 2014, 5,193 ionization chambers were calibrated in terms of absorbed dose to water. A small differences were seen between calibration factors ND,w and Nx multiplied by kD,X for cylindrical chambers. ND,w are slightly lower than Nx IkD,x for cylindrical type. The main reason is air gap between chamber wall and water-proofing sleeve. However, there is no difference between calibration factors for flat type chambers. The reason is The standard deviation of calibration factors in consecutive two calibration using absorbed dose to water improved

clearly. For Chambers calibrated with water absorbed dose 2 times or more the changes of calibration factors were small compared to the former calibration system using exposure in air. This shows that the new calibration system of ANTM is well organized and calibration factors are delivered to radiotherapy institutions with less uncertainty.

A new system of doimeter calibration system using absorbed dose to water has started in Japan. The differences of calibration factors are so small that the system is operated stably and satisfactrily.

SP027 - Development and Application of Phantoms in Clinical Dosimetry

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP027.1 - Fabrication of radiotherapy phantoms using 3D printing Author(s): <u>Paul Z.Y. Liu</u>, David R. Mckenzie, Natalka Suchowerska School Of Physics, University of Sydney, Camperdown/NSW/AUSTRALIA

Aim

3D printing is becoming more affordable and accessible. The aim of this work is to demonstrate the feasibility of using this technology to create dosimetric phantoms and customized anatomical phantoms that would otherwise be difficult to manufacture. These phantoms were designed and printed to explore the methodology, advantages and disadvantages of 3D printing techniques.

Method

The cylindrical dosimetric phantom, created in CAD software (*Sketchup*), was customized to hold an array of scintillation dosimeters to validate arc and multi-directional treatments. The anatomical phantom was created using patient CT data, which was converted into a 3D model using *ImageJ*. The open source software *Meshlabs* was then used to prepare the model for printing.

The phantoms were printed using fused deposition with the UP 3D printer (*3DPP*). Both phantoms were printed as hollow objects and filled with two types of material: dental wax and gel bolus. The resulting phantoms were CT scanned to determine their density and uniformity and irradiated with a therapeutic beam to assess their suitability.

Results

The 3D printed phantoms are shown in Figure 1. CT scans of the printed and filled phantoms showed a uniform electron density with less than 2% variance. Gel bolus yields a uniform phantom that is close to water in mass density (pgel = 1.07 g cm^{-3}). Dosimetric characterisation of the cylindrical dosimetric phantom filled with gel bolus showed low angular dependence (< 0.6%) indicating that the scintillator was located accurately on the axis.

The anatomical phantom provided an accurate surface representation of the CT image. However, the phantom density does not reflect that of the real anatomy. Other 3D printing techniques, such as selective laser sintering and stereolithography, were found to create solid phantoms of a chosen density without the need to be filled.

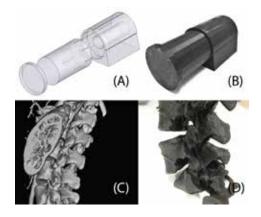

Figure 1. (A) The cylindrical dosimetric phantom in CAD and (B) the 3D printed phantom. (C) A CT scan of the spinal cord and (D) its printed representation.

Conclusion

The fabrication of radiotherapy phantoms using 3D printing is fast and cost effective. Fused deposition is suitable for creating dosimetric phantoms using wax or bolus to fill a hollow model. Customized patient dosimetry can be achieved with 3D printing of anatomical phantoms, however, more sophisticated printing techniques will be required to achieve the desired mass and electron densities.

SP027.2 - The effect of bismuth shielding during pediatric neck multi-detector computed tomography on thyroid dose and image quality

Author(s): <u>Stephen Inkoom</u>¹, Antonios E. Papadakis², Maria Raissaki³, Kostas Perisinakis², Cyril Schandorf⁴, John J. Fletcher⁵, John Damilakis²

¹Department Of Medical Physics, Faculty of Medicine, University of Crete, Iraklion/GREECE, ²Department Of Medical Physics, University Hospital of Heraklion, Iraklion/GREECE, ³Department Of Radiology, Faculty of Medicine, University of Crete, Iraklion/GREECE, ⁴School Of Nuclear And Allied Sciences, University of Ghana, Kwabenya, Accra/GHANA, ⁵Department Of Applied Physics, Faculty of Applied Sciences, University for Development Studies, Navrongo/GHANA

Background: There are no data on the effect of bismuth shielding on absorbed dose to thyroid gland and image quality of pediatric neck multi-detector computed tomography (MDCT) imaging.

Objectives: To investigate and compare the effect of bismuth shielding on thyroid dose, effective dose and image quality in pediatric neck MDCT performed using either fixed tube current or automatic exposure control (AEC) techniques.

Methods: Four pediatric anthropomorphic phantoms that represent the average individual as newborn, 1-year-old, 5-year-old and 10-year-old child underwent routine neck computed tomography (CT) scans using a 16-slice MDCT system. Scans were performed using a) fixed tube current and b) activated-AEC technique. Each scan was performed a) without bismuth shield, b) using a singleand c) using a double-layered bismuth shield placed on the skin surface above the thyroid gland. Scans were repeated following placement of cotton spacers 1, 2 and 3 cm thick between the skin and the shield, to study the effect of skin-to-shielding distance on image noise. Thyroid dose was measured with thermoluminescent dosimeters. The location of the thyroid gland within the phantom slices was determined using a novel approach which employed anthropometric data from CT examinations of patients with body size that closely matched the size of the phantoms. Effective dose (ED) was estimated using the dose length product (DLP) method and specific normalized effective dose per DLP conversion factors for neck, according to the 2007 recommendations of the International Commission on Radiological Protection. Image quality was evaluated on the basis of image noise, which was measured as the standard deviation of the Hounsfield unit (HU) values in selected image regions of interest.

Results: In fixed tube current shielded technique, thyroid dose reduction for single-layered-shield was 17% for newborn and 35% for 10-year-old, and for double-layered-shield was 25% for newborn and 47% for 10-year-old. The dose reduction for AEC-activated unshielded was 27% for newborn and 46% for 10-year-old. The corresponding reduction in AEC-activated scans for single-layered-shield was 40% for newborn and 60% for 10-year-old, and for double-layered-shield was 40% for newborn and 66% for 10-year old. Activation of AEC unshielded compared to fixed tube current unshielded increased the ED by 7% for 1-year-old and decreased

ED by up to 27% for 5-year-old. Image noise was found to be up to 71.5, 112.5, 72.2, and 138.2 HU for fixed tube current single-layered, fixed tube current double-layered, AEC-activated single-layered and AEC-activated double-layered shields, respectively. Elevation of shields by 1, 2 and 3 cm using cotton spacers between shields and phantoms decreased image noise, by 22.0, 9.4 and 5.5 HU respectively for fixed tube current single-layered-shield, while it did not considerably affect thyroid dose. Similar trends were observed for other protocols.

Conclusion: AEC was more effective in thyroid dose reduction compared to in-plane bismuth shields during neck MDCT. The use of fixed tube current with double-layered-shields, and AEC shielded further reduced dose; however, this is associated with higher image noise. Application of cotton spacers had no significant impact on the measured doses, but significantly decreased image noise.

SP027.3 - Use of 3D Printed Materials as Tissue-Equivalent Phantoms

Author(s): <u>Tanya Kairn</u>¹, Tim Markwell², Scott Crowe³ ¹Physics, Genesis CancerCare Queensland, Auchenflower/AUSTRA-LIA, ²Physics, Mater Radiation Oncology, South Brisbane/AUSTRA-LIA, ³Radiation Oncology, Royal Brisbane and Women's Hospital, Herston/QLD/AUSTRALIA

This study used the example of 3D printing with acrylonitrile butadiene styrene (ABS) as a means to investigate the potential usefulness of benchtop rapid prototyping as a technique for producing patient specific phantoms for radiotherapy dosimetry. Phantom samples were evaluated in terms of their geometric accuracy, tissue equivalence and radiation hardness, when irradiated using a range of clinical radiotherapy beams.

Three small cylinders and one model of a human lung (with tumour) were produced via in-house 3D printing with ABS, using 90%, 50%, 30% and 10% ABS infill densities. Physical measurements were used to test the geometric accuracy of the phantoms. Hounsfield unit values in CT scans of the sample phantoms were used to evaluate the tissue equivalence of the phantoms, in terms of densities and linear attenuation coefficients. The attenuation and scattering effects of the phantoms were also evaluated and compared with the effects of commercial tissue- and lung-equivalent plastics, using film measurements, in five different clinical electron beams and three different photon beams. The radiation sensitivity of the samples was assessed by irradiating the samples for several hours a day for 30 days and then remeasuring the densities and physical dimensions of the samples.

The measured dimensions of the small cylindrical phantoms all matched their planned dimensions, within 1mm. The lung phantom was less accurately matched to the lung geometry on which it was based; the use of manual contours to produce an initial design from the CT images led to some simplification of the shape of the lung and some conservative over-estimation of the size of the tumour.

The cylindrical 3D-printed phantoms with ABS infill densities of 30, 50 and 90% were all found to be relatively homogeneous and to exhibit densities and attenuation coefficients within the range of values identified in the commercial tissue-equivalent materials. Film measurement results confirmed that the attenuation and scattering effects of these samples were similar to the effects of established lung- and tissue-equivalent materials. By contrast, the mesh produced by the 3D printing software, when required to produce a phantom with a 10% ABS infill density was so coarse that an anatomically unrealistic structure consisting of solid ABS walls around relatively large (6 mm diameter) air chambers was clearly resolvable in the CT images of the resulting phantom.

The results of this study suggest that phantoms printed with ABS,

using infill densities of 30% or more, are potentially useful as lungand tissue-equivalent phantoms for patient-specific radio-therapy dosimetry. A 90% ABS infill density was found to result in a material suitable for modelling tumour, muscle or other soft tissue, while ABS infill densities of 30-50% resulted in phantoms with densities low enough to model lung while also avoiding the course mesh structures that occur when lower infill densities (such as 10% ABS) are used. All cylindrical 3D printed phantom samples were found to be unaffected by prolonged radiation and to accurately match their design specifications. However, care should be taken to avoid over-simplifying anatomical structures when printing more complex phantoms.

SP027.4 - Development of water-equivalent materials using the Least Squares Method

Author(s): Leandro Mariano, Paulo R. Costa

Radiation Dosimetry And Medical Physics Group, Physics Institute, University of São Paulo, São Paulo/BRAZIL

Introduction: The study of water-equivalent materials, which have radiation attenuation and scattering properties similar to the human tissue, is central to the calculation of patient doses in many medical imaging applications. Chemical formulation using thermoplastics as a base and additives for the production of phantoms were developed by the authors for diagnostic imaging energy range (10-150keV).

Methods: The initial composition of the materials was obtained using the Hermann Method. Originally, this method allows the use of three base materials for the manufacture of the water-equivalent materials. In the present work, the Hermann's methodology was generalized to allow the consideration of a generic number of base and addictive materials. The Least Square Method was used as well to obtain the composition of the water-equivalent materials. The methodology was to fit the linear attenuation coefficient of the mixture directly on the linear attenuation coefficient of water.

Results and Discussion: The procedure developed in this work has advantages over the Hermann Method since it takes into account the linear attenuation coefficient over the entire energy range of interest. The Figure 1 shows the comparison of the linear attenuation coefficient for two formulations obtained by these methods using the same base materials.

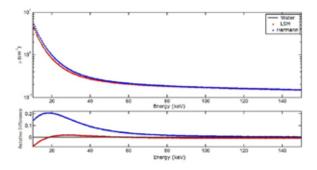

Figure 1 – Linear attenuation coefficient of two water-equivalent materials using the Hermann and the Least Square Methods (LSM).

Moreover, the transmitted and scattered X-ray spectra of some compositions were experimentally measured and simulated using the PENELOPE code.

Conclusions: The results have shown a good agreement with the water attenuation and it has validated this methodology. The Monte Carlo Method can also be very useful to determine the characteris-

tics of transmission and scattering of x-rays of the materials, without requiring its previous manufacture.

Acknowledgments: The authors thank CNPq for financial support under project 167332/2014-7 and CNPq/FAPESP INCT Rad Metrology in Medicine.

SP027.5 - Development of deformable moving lung phantom to simulate respiratory motion for lung SBRT

Author(s): Young Nam Kang¹, Ji Na Kim², Hyung Wook Park³, Hong Seok Jang¹

¹Department Of Radiation Oncology, Seoul St. Mary's Hospital, College of Medicine, The Catholic University of Korea, Seoul/KO-REA, ²Department Of Biomedical Engineering, College of Medicine, The Catholic University of Korea, Seoul/KOREA, ³Department Of Radiation Oncology, Yeouido St. Mary's Hospital, College of Medicine, The Catholic University of Korea, Seoul/KOREA

Stereotactic body radation therapy (SBRT) requires high accuracy in order to protect healthy organs and destroy the tumor. However, tumors located near the diaphragm are constantly moving during treatment. Respiratory-gated radiotherapy has significant potential for the improvement of the irradiation of tumor sites affected by respiratory motion, such as lung and liver tumors. To measure and minimize the effects of respiratory motion, a realistic deformable phantom is required for use as a gold standard. The purpose of this study was to develop and study the characteristics of a deformable moving lung (DML) phantom, such as simulation, tissue equivalent, and rate of deformation. The rate of change of the lung volume, target deformation, and respiratory signals were measured in this study; they were accurately meaured using a realistic deformable phantom. The measured volume difference was 30%, which closely corresponds to the average-difference in human respiration, and the target movement was -30 mm-+30 mm. The measured signals accurately described human respiratory signals. This DML phantom will be useful for the estimation of deformable image registration and in lung SBRT. This study shows that the developed DML phantom can exactly simulate the patient's respiratory signal and it acts as a deformable 4D simulation of a patient's lung with sufficient volume change.

SP027.6 - Characterization of a MOSFET-based system for skin dose evaluation with bolus material

Author(s): <u>Anabela G. Dias</u>¹, Diana F.D.S. Pinto² ¹Física Médica, Instituto Português de Oncologia do Porto Francisco

Gentil, Porto/PORTUGAL, ²Radioterapia, Instituto Português de oncologia Francisco Gentil do Porto, Porto/PORTUGAL

Purpose/Objective

Post-surgery radiation therapy is one the treatment steps of locally advanced breast cancer. In vivo skin dose evaluation of the chest wall region is important to ensure sufficient dose in structures near surface and it is a valuable tool during radiation treatment to verify the delivered dose to the target. It is also useful to assess the scattered radiation to the contra-lateral breast. In certain cases, to increase the skin dose, a bolus material with a specific thickness is frequently placed on the chest wall during the last ten treatment fractions.

The purpose of this work was to characterize a MOSFET-based system for in vivo skin measurements in megavoltage radiation (4 MV and 6 MV) and compare calculated and measured dose with and without bolus material.

Materials/Methods

Full characterization and calibration of the MOSFET-based system was performed regarding reproducibility, linearity, energy, angular, field size and source to surface distance (SSD) dependences for two the photons energies. All measurements with the exception of the angular dependence were performed in a solid water phantom and a Farmer ionization chamber was used for dose comparison. The angular dependence was performed with a Lucy 3D phantom from 0 to 315 degrees in 45 degree increments.

Surface dose on solid water was also assessed in the presence and absence of 1 cm bolus material and compared with calculated dose in the Treatment Planning System (TPS) (only tested with an orthogonal beam).

Results

The detectors presented no energy dependence and a dose linear response for the dose range studied. The measured dose standard deviation varied from 1% to 10% depending on the number of MUs (higher deviation for lower MUs) and the detector. In the therapeutic dose range, the standard deviation for all the detectors is less than 2%. The angular dependence study showed that the deviation is less than 2% over 360°. For SSD response, the system showed linear dependence. Field size dependence was also analyzed and was found to be negligible. Surface dose without bolus is about 50% less than with bolus. The comparison between the TPS calculated and measured doses with and without bolus showed a maximum difference of 5%.

Conclusion

Tests performed on the behavior of the measuring system in reference conditions have results consistent with the manufacturer's specifications for the studied energies. The results show that this system is suitable for in vivo skin dose dosimetry in MV range with and without using bolus material in breast external radiotherapy treatments.

SP027.7 - Calibration procedure optimization through PSDesigner, a multipurpose simulation platform for plastic scintillation dosimeters

Author(s): <u>Cedric Laliberte-Houdeville</u>, Luc Beaulieu, Louis Archambault

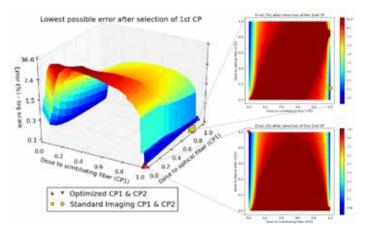

Département De Physique, De Génie Physique Et D'optique, Université Laval, Québec/CANADA

Background The literature offers a wide variety of plastic scintillation dosimeter (PSD) and multipoint PSD proof-of-concept that demonstrate how the use of plastic scintillators can lead to accurate, online and in-vivo dosimeters for radiotherapy and brachytherapy. Nevertheless this accuracy is highly dependent on the calibration procedure and the choice of calibration points (CPs). Due to the lack of clear recommendations, researchers often rely on past experiences and generally accepted consideration to calibrate their specific systems. This study presents a numerical technique to find the optimal CPs of any PSD designs. Designs inspired by the commercially available Exradin W1 and the 2- and 3-points-PSD prototypes recently published by *Therriault-Proulx et al.* are revisited. Their calibration procedures are evaluated and improved to show this technique's capabilities and potential use for future PSD designs of ever-increasing complexity.

Methods This study uses *PSDesigner*, a multi-purpose simulation platform written in Python to generate and evaluate virtual PSDs. With the extensive use of physical data as inputs, this platform can, among others, select optimal CPs. First, virtual PSDs are generated using emissions, attenuation and transmission spectra and response curve of commercially available optical components. Second, calibration procedure involving noisy readings as well as systematic offsets are simulated, generating flawed calibrated PSD. Finally, a stochastic algorithm searches for the best CPs resulting in the most accurate PSD.

Results For the simpler, commercially available Exradin W1-design PSD, Figure 1 shows where optimal CPs ought to be selected. Both the optimal CPs and the ones suggested by Standard Imaging are shown. The latter offers a 0.4% precision on dose measurement; the former improves it down to 0.2%. Figure 1 also shows how intermediate dose to the scintillator, generated in high dose gradient regions, are to be avoided.

The same analysis can be made for a 2-points-PSD inspired system. The optimized CPs, not shown here, result in a 0.6% precision for both measurement points. Work on 3 and more points PSD system is ongoing.

Conclusions The simulation platform developed validates past calibration procedures and shows its useful capabilities for future, more complex PSD design. It goes further, giving the user quantitative insight on how its procedure can be improved and how that will affect dose measurements. The code is versatile and can help researchers optimize complex PSD systems in other ways, notably through the optimal selection of optical components.

SP028 - HIFU Therapy, Microwave Ablation, Radiofrequency Ablation, Cryotherapy

TRACK 06: NEW TECHNOLOGIES IN CANCER RESEARCH AND TREATMENT

SP028.1 - On Understanding of the Limiting Factors in Radiofrequency Ablation on Target Tissue Necrosis Volume Author(s): Bing Zhang¹, Michael Moser², Edwin Zhang³, Yigang

Luco², Wenjun Zhang⁴

¹Complex And Intelligent Systems Research Center, East China University of Science and Technology, Shanghai/CHINA, ²Surgery, University of Saskatchewan, Saskatoon/CANADA, ³Radiology And Diagnostic Imaging, University of Alberta, Saskatoon/CANA-DA, ⁴Biomedical Engineering, University of Saskatchewan, Saskatoon/CANADA

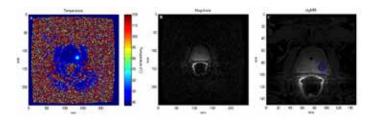

The aim of this study was to analyze six limiting factors that may be responsible for target tissue necrosis (TTN) generation during the process of radiofrequency ablation (RFA). A comprehensive finite element (FE) model was built to simulate TTN of a liver tissue by using a commercial available RFA system. The model was then served as a test-bed for analysis of factors. Six limiting factors were analyzed using a statistical method. Sixteen RFA experiments were performed, in which the TTN volume was considered as a response variable along with the six control factors. The TTN volumes obtained from the 16 simulations were quite different, ranging from 7.749 to 8433.931 mm³. The applied voltage (V), the frequency (f), the exposure length (L) of the RF electrode, the chilled fluid temperature (T), the large blood vessel (d) in the proximity to target tissue, and the ablation duration (t) account for approximately 78.21%, 9.93%, 2.91%, 0.01%, 4.64%, and 0.08%, respectively, of the effect on the TTN volume. The findings from the present study suggest that the applied voltage (V) and the frequency (f), followed by the large blood vessel (d) in proximity to target tissue, have the highest effect on the TTN volume.

SP028.2 - Thermal Dose Based Monitoring of Thermal Therapy for Prostate Cancer

Author(s): David Dalla Rosa¹, Hisham Assi², <u>Joseph C. Kumaradas³</u> ¹Apotex, Toronto/CANADA, ²Biomedical Engineering, University of Toronto, Toronto/ON/CANADA, ³Physics, Ryerson University, ON/ CANADA

Thermal dose is a metric for quantifying the amount of thermal damage taking temperature and exposure time into account. An ideal thermal dose model should produce the same dose for a given amount of damage, regardless of the heating protocol used, or the time-temperature profile that caused the damage. The cumulative-equivalent-minutes at 43 Celsius (CEM43) is the most commonly used thermal dose model. It was originally developed for hyperthermia applications (less than 45 Celsius). The validity and accuracy of this mode for higher temperatures, above 50 Celsius is questionable. A new thermal dose model based on the Arrhenius type Vogel-Tammann-Fulcher equation, known as the improved cumulative equivalent minutes at 43 Celsius (iCEM43), has been developed and fit to publish historic thermal data.

The CEM43 and iCEM43 dose models have been retrospectively used to assess the dose delivered to during laser thermal therapy of low-grade prostate cancer, in order to test the consistency of the two methods. This was done by obtaining MRI thermometry images during treatment and gadolinium enhanced MRI images post-treatment to assess vascular shutdown (as an indicator of acute thermal damage), as shown in the figure below. The iCEM43 dose model was found to be more consistent than the CEM43 dose model in predicting post-treatment vascular shutdown.

SP028.3 - Nanodrug Delivery and Anti-tumor Efficacy for Brain Metastasis of Breast Cancer Enhanced by Short-time Lowdose Ultrasound Hyperthermia

Author(s): <u>Sheng-Kai Wu</u>¹, Chi-Feng Chiang¹, Yu-Hone Hsu¹, Tzu-Hung Lin², Houng-Chi Liou², Wen-Mei Fu², Win-Li Lin³ ¹National Taiwan University, Institute of Biomedical Engineering, Taipei/TAIWAN, ²National Taiwan University, Institute of Pharmacology, Taipei/TAIWAN, ³National Health Research Institutes, Institute of Biomedical Engineering and Nanomedicine, Miaoli/TAIWAN

Ultrasound hyperthermia can enhance the delivery of chemotherapeutic agents into tumors, while the blood-brain/tumor barrier inhibits the uptake and accumulation of chemotherapeutic nanodrugs in brain tumors. In this study, we investigated the effects of short-time low-dose (STLD) focused ultrasound (FUS) hyperthermia on the delivery and therapeutic efficacy of pegylated liposomal doxorubicin (PLD) for brain metastasis of breast cancer. Murine breast cancer 4T1-luc2 cells expressing firefly luciferase were injected into female BALB/c mice striatum tissues and used as a brain metastasis model. The mice were intravenously injected with PLD with/without STLD transcranial pulsed/continuous wave FUS hyperthermia on day 6 after tumor implantation. The amounts of doxorubicin accumulated in the normal brain tissues and tumor tissues with/without FUS hyperthermia were measured using fluorometry. The tumor growth for the control, hyperthermia, PLD, and PLD+hyperthermia groups was measured using an IVIS spectrum system every other day starting from day 3. Cell apoptosis and tumor characteristics were assessed using immunohistochemistry. The experimental results showed that STLD transcranial FUS hyperthermia was able to significantly enhance the PLD delivery into brain tumors. The tumor growth was effectively inhibited by a single treatment of PLD+hyperthermia compared with both PLD alone and STLD FUS hyperthermia alone. Immunohistochemical examination further demonstrated the therapeutic efficacy of PLD plus STLD FUS hyperthermia for brain metastasis of breast cancer. The results also showed that with the same STLD, pulsed-wave can even produce a better therapeutic result than continuous-wave FUS hyperthermia. This study indicates that the application of STLD FUS hyperthermia after nanodrug injection may be an effective approach to enhance nanodrug delivery and improve the treatment of metastatic cancers.

SP028.4 - Evaluating breast cancer surgical margins using high-frequency ultrasound: Statistical analysis of a 17-patient pilot study

Author(s): <u>Robyn K. Omer</u>¹, Kristina M. Sorensen², Rachel E. Factor³, Leigh A. Neumayer⁴, Timothy E. Doyle¹ ¹Physics, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA, ²Mathematics, Pennsylvania State University, State College/PA/UNITED STATES OF AMERICA, ³Pathology, University of Utah, Salt Lake City/UT/UNITED STATES OF AMERICA, ⁴Surgery.

University of Arizona, Tucson/AZ/UNITED STATES OF AMERICA

A critical goal in breast conservation surgery (BCS) is to obtain negative surgical margins to ensure removal of all cancerous tissue. This process usually requires a period of several days to evaluate margin status with conventional pathology, and results in re-excisions for 20-60% of BCS patients due to the lack of a rapid, noninvasive method to evaluate margins in the operating room. Several methods are therefore being investigated for the intraoperative evaluation of margin status. High-frequency (HF) ultrasound (20-80 MHz) was investigated in a 17-patient pilot study for intraoperative margin evaluations during BCS. Through-transmission measurements were acquired from 53 positions on 34 excised specimens at the Huntsman Cancer Institute, Salt Lake City, Utah. Specimens included lymph nodes, surgical margins, tumors, and fibroadenomas. Measurements were acquired with the use of two 50-MHz immersion transducers (Olympus NDT, V358-SU), a HF square-wave pulser/receiver (UTEX, UT340), and a 500-MHz digital oscilloscope (Hewlett-Packard, HP-54522A). Ultrasonic waveforms were averaged in the signal acquisition and downloaded onto a notebook PC using LabVIEW. Parameters acquired from the data included peak density (the number of peaks and valleys in the 20-80 MHz band of the ultrasonic spectra) and attenuation. Peak density is strongly dependent on scattering processes and thus microstructural heterogeneity in the tissue. Statistical analysis of the data for differentiating between malignant and nonmalignant tissue revealed that peak density and attenuation by themselves provided lower accuracy and sensitivity as compared to a multivariate analysis combining the two parameters. Results from the multivariate analysis showed 81.1% accuracy, 76.9% sensitivity, and 85.2% specificity. Table 1 compares the accuracy, sensitivity, and specificity values of HF ultrasound with alternative technologies for intraoperative BCS margin assessments, and shows HF ultrasound is competitive with both small specimen mammography and radio-frequency spectroscopy. Approaches for improving the HF ultrasound method include using additional parameters in the multivariate analysis such as wave speed, calibrating the measurements with phantoms, and conducting larger studies with statistically relevant numbers of patients, specimens, and measurement positions. Such a study at the Huntsman Cancer Institute is currently near completion, and includes 73 patients, 485 specimens, and 1112 measurement positions. Preliminary results are consistent with those from this study.

Table 1. Comparison of results from prospective and clinical trials of margin evaluation methods including small-specimen mammogra-phy, radio-frequency spectroscopy, and high-frequency ultrasound.

Method	Small-specimen Radio- frequency mammography1 spectros- copy2		High-frequency ultrasound	
Patients	102	298	17	
Speci- mens	102	298	34 (53 positions)	
Accuracy	78.4%	62.1%	81.1%	
Sensitivity	Sensitivity 58.5%		76.9%	
Specific- ity 91.8%		46.7%	85.2%

SP028.5 - The Intraoperative Detection of Breast Cancer in Surgical Margins Using High-Frequency Ultrasound: Studies Using Histology Mimicking Phantoms

Author(s): Zachary A. Coffman¹, Nicole Cowan², Robyn K. Omer³, Timothy E. Doyle⁴

¹Biology, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA, ²Biotechnology, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA, ³Botany, Utah Valley University, Orem/UT/ UNITED STATES OF AMERICA, ⁴Physics, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA

Breast cancer is the second most prevalent cancer among women, affecting one out of eight in their lifetime. The ability to differentiate between malignant and normal tissues during breast cancer surgery would enable the surgeon to remove all of the cancer from the affected region in the breast, thereby reducing the risk of recurrence and the need for subsequent surgeries. Two studies conducted at the Huntsman Cancer Institute (Salt Lake City, Utah) showed that high-frequency (HF) ultrasound (20-80 MHz), and in particular the ultrasonic parameters peak density and attenuation, were sensitive to breast tissue pathology. The objective of this study was to determine the effect of tissue microstructure on peak density and attenuation using phantoms that mimic the histology of breast tissue. Phantoms were created from a mixture of distilled water, agarose powder, and 10X TBE stock solution. In order to simulate breast tissue histology and breast density, polyethylene microspheres were embedded into the phantoms in layers, totaling 4 layers per phantom. In one experiment, the volume percent of polyethylene microspheres was kept constant in each phantom while varying microsphere sizes (58-925 µm diameter). In a second experiment, the polyethylene microsphere size (90-106 µm diameter) was kept constant within each phantom while the weight percent concentration of the microspheres varied (0.00g to 0.06g). Pitch-catch measurements were acquired using 50-MHz transducers (Olympus NDT, V358-SU, 0.635-cm diameter active element), a HF pulser-receiver (UTEX, UT340), and a 1-GHz digital oscilloscope (Agilent, DSOX3104A). Glycerol (Genesis Scientific) was used as a coupling agent between the transducers and the phantoms. Spectra were derived from the data, giving peak density (the number of peaks and valleys in the 20-80 MHz range) and attenuation values. The results show that peak density is much more sensitive to the size of the heterogeneity and follows an inverse size (microsphere diameter) relationship, while attenuation is sensitive to the number of heterogeneities present. These results demonstrate that the HF ultrasound parameters, peak density and attenuation, are sensitive to changes in microstructure or heterogeneity observed in malignant breast tissue. Clinical breast cancer studies also showed that, when combined in a multivariate analysis, peak density and attenuation increased the accuracy, specificity, and sensitivity of the measurements for malignant tissue. The high-frequency ultrasound results from the agarose phantoms confirm that peak density and attenuation are complementary parameters for characterizing breast tissue pathology and validate the clinical breast cancer studies conducted at the Huntsman Cancer Institute.

SP028.6 - Rapid Molecular Subtyping of Breast Cancer Using High-Frequency Ultrasound (10-120 MHz) and Principal Component Analysis

Author(s): <u>Caitlin Carter</u>¹, Laurel A. Thompson², Amy Fairbrother¹, Timothy E. Doyle³

¹Biology, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA, ²Chemistry, Utah Valley University, Orem/UT/UNITED STATES OF AMERICA, ³Physics, Utah Valley University, Orem/UT/ UNITED STATES OF AMERICA

Introduction: The molecular subtypes of breast cancer correlate more strongly to prognosis and treatment response than traditional classifications based on genetic and protein expression profiles. The mutations found in aggressive subtypes (basal-like and Her2+) alter the expression levels of proteins that regulate the actin cytoskeleton, thereby altering the biomechanical and ultrasonic properties of the cell. Current methods of testing these changes do not easily transfer to real-time diagnostic methods. The ability to determine the subtype of breast tumors during surgery or biopsy would provide physicians with new diagnostic capabilities to screen suspicious lesions, as well as perform high-precision surgery and personalize treatment for patients.

Objective: The hypothesis of this work was to determine the feasibility of using high-frequency ultrasound and principal component analysis (PCA) to characterize and phenotype different molecular subtypes of breast cancer cell lines, and to determine the sensitivity of high-frequency ultrasound to changes in biomechanical properties of the cell.

Methods: Computer simulations were performed to determine if changes in the bulk and shear moduli of the cell cytoplasm would measurably alter high-frequency ultrasonic spectra. To verify these models, ultrasonic measurements of seven breast cancer cell lines with different molecular subtypes were obtained over a period of two years by taking pulse-echo measurements of the cell layer with a 50-MHz transducer immersed directly in the growth media of the cell culture plates. The cell reflections within the waveforms were isolated and spectrally analyzed using computer models and PCA. Heat maps were then generated using relative distances between PCA scores of experimental data and model spectra. These heat maps were used to classify the spectra for subtype profiling. A secondary experiment was performed to validate that the cell reflections isolated from spectral data were in fact the waveforms of the cellular monolayer signal, and to determine if chemical modification of the cytoskeleton could be observed with ultrasound. This was done by treating a cell culture with colchicine which is a known inhibitor of cytoplasmic microtubule formation. Measurements of the treated culture were taken incrementally over a period of 90 minutes to record the effect on the cell signal in real time.

Results: Computer models showed that changes in biomechanical properties of the cell cytoplasm would significantly alter the cell's ultrasonic properties. Experimental results showed that each cell line produced a unique spectral signature while also demonstrating changes due to seeding density. This showed the sensitivity of high-frequency ultrasound to changes in cell microenvironment as well as the molecular subtype of the cells. The colchicine data also verified changes in the cell signal due to the modification of cytoplasmic microtubules. The heat map generated from PCA was able to classify the measured spectra of each cell line based on their individual biomechanical and morphological properties.

Conclusions: The experimental and computational results of this work have demonstrated that high-frequency ultrasound is a feasible method for rapid molecular subtyping of breast cancer. Principal component analysis of the spectral data has additionally demonstrated a prospective approach for the characterization of molecular subtypes.

SP028.7 - Inverse treatment planning using radiofrquency ablation in cancer therapy

Author(s): <u>Shefali Kulkarni-Thaker</u>¹, Dionne Aleman¹, Aaron Fenster² ¹Department Of Mechanical And Industrial Engineering, University of Toronto, Toronto/CANADA, ²Imaging Research Laboratories, Robarts Research Institute, London/CANADA

Radiofrequency ablation (RFA) offers localized and minimally invasive ablation of small-to-medium sized inoperable tumors. In RFA, tissue is ablated due to high temperatures obtained from the current passed through electrodes inserted percutaneously or via open surgery into the target. However RFA can cause incomplete ablation due to several reasons including incorrect needle position. We develop a mathematical framework for pre-operative inverse treatment plans for single and multiple RFA applicators. Borrowing techniques from radiosurgery inverse planning, we design a two stage algorithm where we first identify needle position and orientation, referred to as needle orientation optimization, and then compute the treatment time for optimal thermal dose delivery using thermal dose optimization (TDO). We develop linearly-relaxed TDO models using various thermal damage models including threshold temperature using Pennes Bioheat transfer equation (BHTE) and Arrhenius damage index. We present experimental results on three clinical case studies with 3D patient models.

SP029 - Surgical Navigation: Part 1

TRACK 07: SURGERY, COMPUTER AIDED SURGERY, MINIMAL INVASIVE INTERVENTIONS, ENDOSCOPY AND IMAGE-GUIDED THERAPY, MODELLING AND SIMULATION

SP029.1 - Preliminary evaluation of positron emission based 3D tracking system (PeTrack) in image guided interventions Author(s): <u>Simin Razavi</u>¹, Benjamin Spencer², Marc Chamberland³, Tong Xu³

¹Department Of Physics, Carleton University, Ottawa/CANA-DA, ²TIMC-IMAG Laboratory, La Tronche cedex/FRANCE, ³Department Of Physics, Carleton University, Ottawa/ON/CANADA

In minimally invasive surgeries, a surgeon needs to precisely locate the surgical tools. The recent advancements in image guided surgeries have enabled monitoring the position of the operative tools in the vicinity of internal organs. We are developing a new real-time three- dimensional (3D) tracking technique for medical procedures called PeTrack (Positron Emission Tracking). PeTrack is designed to track the location of a positron emitting fiducial marker(s) using two pairs of position sensitive gamma ray detectors. The marker can be attached to surgical instruments (e.g. a catheter). PeTrack provides the location of the marker in real-time. PeTrack is co-registered with an x-ray C-arm to enable the navigation (Figure1).

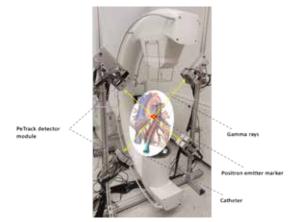

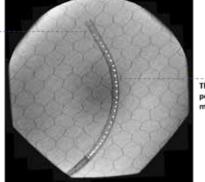

Figure 1

The emitted positron from fiducial marker annihilates with an electron, producing two gamma rays in opposite directions. Gamma rays which belong to single annihilation create coincidence line (COIL). The true location of PeTrack marker is defined to have the minimum root mean square distance to all of the COILs collected in a short time interval (e.g.100 ms). We studied the sensitivity and distortion of PeTrack by Monte-Carlo simulations and experiments. Results show that the sensitivity fluctuates within the detector field of view and revealed a non-uniform distortion. The distortion can be reduced less than 1 mm by correcting for systematic errors. We also performed a navigation experiment by moving a 13.5 μ Ci marker along a simulated blood vessel and co-registered its positions with an x-ray projection image. Figure 2 shows that PeTrack correctly tracked the locations of the marker.

Aluminum tube resembling a blood vessel

The tracked position of the marker by PeTrack

Figure 2

The small dose from the PeTrack marker is offset by the dose reduction when using PeTrack for tracking instead of continuous x-ray fluoroscopy. Therefore, as a wireless tracking technique with submillimeter marker and sub-millimeter accuracy, PeTrack has a great potential for 3D navigation during image guided surgery.

SP029.2 - Seymour Shield – An Operative Adjunct Device for Maintaining Visualization during Laparoscopic Surgery Author(s): <u>Karthik Kannan</u>¹, Foad Kabinejadian², Leo Hwa Liang¹, Justin Phoon³, Perline Teo⁴, Ng T. Kiat⁵, Luke Tay⁶ ¹Bio-engineering Department, National University of Singapore, Singapore/SINGAPORE, ²Department Of Surgery, National University of Singapore, Singapore/SINGAPORE, ³QiG Group, singapore/ SINGAPORE, ⁴A*STAR, singapore/SINGAPORE, ⁵Senior Consultant, Urology, National University Hospital, singapore/SINGA-PORE, ⁶General Surgery,, Singapore General Hospital, singapore/ SINGAPORE

During Minimally Invasive Surgery or Laparoscopic Surgery, the surgeon is absolutely dependent on the view from the camera. Yet, the rigid-endoscopic camera lens is prone to getting fouled by smoke, fog, blood and/or vaporized organic debris, all of which obstruct vision and thus necessitates removal of scope from abdomen for cleaning. So when lens fouling happens, surgical workflow halts entirely, which jeopardized patient's safety when visualization is truncated. Hence the scope is removed and the lens is manually cleaned by the nurse with the help of the gauze. Lens is warmed frequently by submerging the tip into a thermos-flask filled with warmed water and it is dried to prevent fogging. Surgeon must then return camera to its previous location and spatially re-ordinate himself in order to resume work. Disruptions in workflow may lead to conversion to open surgery for emergency measures, especially during active bleeding. Currently, conversion rate stands at 10% for most of the laparoscopic surgeries. Time lost contributes to operative duration, which is an independent risk factor for morbidity, as well as cost to the healthcare system. Given that 3.1 million laparoscopic surgeries were performed in USA in 2012 (projected to grow at 5-8%), we estimate a total of 386,000 hours spent cleaning the scope, representing wastage of USD 347 Million in terms of theater time to healthcare system.

At present, laparoscopic sheaths have been devised with fluid irrigation channels that enable lens cleaning without scope removal (EndoScrub 2, Medtronic). However, this still involves loss in visualization and disruption of surgical flow while irrigation is taking place. Recently, a sheath generating air vortex distal to the lens has been developed which disperses smoke produced during electro-cautery dissection (Floshield, MID Surgical). However it is not effective against blood splatter and thus fails to protect the lens during the most critical moments of the surgery.

Hence, to overcome the above defects, we developed a novel

device, the one-stop solution which addresses all the problems encountered. Our product Seymour Shield is a 12mm/14mm sheath that fits over the conventional 10 mm laparoscopic camera with a distal, constantly-rotating, clear, transparent disc (shield). The rotation servers two purposes: firstly, to remove or prevent buildup of excess fluid and particulate debris on the visualization surface by centrifugal force, and secondly to produce an optical illusion of clarity exploiting physiological persistence of vision and the flickerfusion threshold of human sight. We are using compressed air\\ vacuum which is available readily in Operation Theater as a driver for the whole process. Rotor is designed in such a way that it is propelled by the compressed air and the transparent disk or the shield for the lens is embedded into the rotor. So, as the rotor rotates at high speed, the shield too rotates, thereby shattering all the foreign particles. The compressed air can be used by the doctor whenever required, by just pressing the button in the sheath. Thus Seymour Shield offers easy and instant solution for maintaining clear vision throughout the laparoscopic surgery.

SP029.3 - Optimizing MRI-targeted fusion prostate biopsy: the effect of systematic error and anisotropy on tumour sampling Author(s): <u>Peter Martin</u>¹, Derek W. Cool², Cesare Romagnoli², Aaron Fenster¹, Aaron D. Ward³

¹Medical Biophysics, Western University, London/ON/CANA-DA, ²Medical Imaging, Western University, London/CANADA, ³Oncology, Western University, London/ON/CANADA

Background:

Magnetic resonance imaging (MRI)-targeted, 3D transrectal ultrasound (TRUS)-guided "fusion" prostate biopsy intends to reduce the ~23% false negative rate [1] of clinical 2D TRUS-guided sextant biopsy. Although it has been reported to double the positive yield [2], MRI-targeted biopsies still yield false negatives. We propose optimization of biopsy planning, according to the clinician's desired probability of sampling each tumour. This optimizes needle target positions within tumours, accounting for guidance system errors, image registration errors, and irregular tumour shapes.

Purpose:

Random, systematic and anisotropic biopsy needle delivery errors can arise due to patient and prostate motion, image registration errors, and device-to-image calibration issues. The purpose of this work was to investigate the effect of needle delivery error on tumour sampling probabilities, as a first step toward our over-arching aim of optimizing the number and placement of biopsy targets to obtain an early and accurate characterization of each patient's cancer.

Methods:

We obtained multiparametric MRI and 3D TRUS images from 49 patients. A radiologist and radiology resident contoured 81 suspicious regions, yielding tumour surfaces that were registered to the TRUS images using an iterative closest point prostate surface-based method. The probability of obtaining a sample of tumour tissue in one attempt was calculated by integrating a 3D Gaussian distribution over each tumour domain, where σ = the needle delivery error. We ran an exhaustive simulation using this error model to investigate how systematic errors and error anisotropy affect tumour sampling probabilities.

Results:

Our experiments indicated that a biopsy system's lateral and elevational errors have a much greater effect on sampling probabilities, relative to axial error. We have also determined that systematic errors with magnitude <2 mm have a relatively small incremental effect on sampling probabilities. For a fusion biopsy system with a typical needle delivery error of 3.5 mm, tumours of volume \leq 1.9 cm³ may require more than one biopsy attempt to ensure 95% probability of a sample with 50% core involvement, and tumours \leq 1.0 cm³ may require more than two attempts (Figure 1).

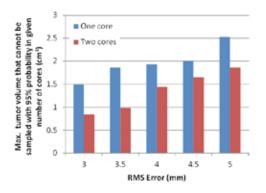

Fig. 1: The upper bound of tumour volume such that there is <95% probability of obtaining a sample with $\ge50\%$ core involvement, given needle delivery error of the biopsy system.

Impact:

Optimized planning of within-tumour targets for fusion biopsy could support earlier diagnosis of prostate cancer while it remains localized and curable.

SP029.4 - Is hemolysis influenced by the dynamic calibration method of CPB roller pumps?

Author(s): Francisco U. Vieira Junior¹, Nilson Antunes², Eduardo T. Costa³

¹Federal Institute of São Paulo, Campinas/BRAZIL, ²Cardiac, Campinas State University, Campinas/BRAZIL, ³Biomedical Engineering, Campinas State University, Campinas/BRAZIL

Introduction: Roller pumps are widely used in cardiopulmonary bypass (CPB) surgeries due to the easy of their operation, maintenance, safety and cost. Several studies have compared the use of roller pumps with centrifugal pumps but few have evaluate the influence of the different roller pump adjusts on hemolysis. The objective of this work was the in vivo analysis of the influence of roller pump adjustment by the dynamic method on hemolysis prevention.

Methodology: We have measured the hemolysis rate of 87 patients submitted to myocardial revascularization, divided in 4 groups, altering the roller pumps adjustment by the dynamic method. We have used an Auxiliary Calibration Device specially developed for this purpose. The adjustments consisted in the monitoring of the pump output pressure (pump at 10 rpm) with the output tube pinched, the pump rollers were adjusted in order to have mean pressures between 75 and 450 mmHg. The adjustment for each group was as follows: Group 1 (n=20) - 75 mmHg ; Group 2 (n=24) – 150 mmHg; Group 3 (n=22) – 300 mmHg; and Group 4 (n=21) – 450 mmHg. The hemolysis rates were measured before the start of CPB (T0) and 5 minutes after CPB (T1). The blood plasma free hemoglobin (HLp) was calculated using a spectrophotometer and the data related to a measurement at instant "t" was corrected for the hemodilution according to the equation below using Htbase = 27,5%:

HPp = HLp(t)*Htbase/Ht(t)

The hemolysis rates (Tx) were calculated for each patient for the interval T0-T1 using the following equation:

Tx = (HLp1 - HLp0)/(T1 - T0)

Results: In Table 1 we show the measurement results for each group. Our results have not shown statistical difference for hemolysis rates between groups (p>0.05).

Table 1 – Registered times during CPB with respective mesasures of free hemoglobin and hemolysis rates. Values are mean \pm standard deviation.

	Group 1 (n = 20)	Group 2 (n = 24)	Group 3 (n = 22)	Group 4 (n = 21)	
	Time (min)	pvaluer*			
T1	0 ± 0	0 ± 0	0 ± 0	0 ± 0	-
T2	95,0±23,2	104,5±22,1	98,7±22,6	104,6±38,2	> 0.55
	HLp (mg/dl)	pvaluer*			
HLp1	9,3 ± 5,0	6,4 ± 2,0	9,6 ± 7,0	9,3 ± 4,0	<0,0001
HLp2	53,7±18,0	48,1±13,0	52,7±14,6	45,4±11,4	> 0,31
	Hemolysis ra	pvaluer*			
Тх	0,5 ± 0,2	0,4 ± 0,1	0,5 ± 0,2	0,4 ± 0,1	> 0,05

* Comparison between groups.

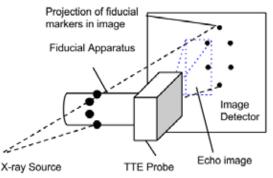

Conclusion: Our results have shown that the calibration of the roller pumps for different adjustments have not influenced the hemolysis rates in the analysed groups. Little occlusive calibrations should be avoided due to possible reflux and errors in flow measurements based on the pump rotation.

SP029.5 - A Fiducial Apparatus for 6DOF Pose Estimation of an External Echo Probe from a Single X-ray Projection: Initial Simulation Studies on Design Requirements

Author(s): <u>Charles R. Hatt</u>¹, Amish N. Raval², Michael A. Speidel³ ¹Medical Physics, University of Wisconsin, Madison/UNITED STATES OF AMERICA, ²Cardiovascular Medicine, University of Wisconsin, Madison/WI/UNITED STATES OF AMERICA, ³Medical Physics, University of Wisconsin, Madison/WI/UNITED STATES OF AMERICA

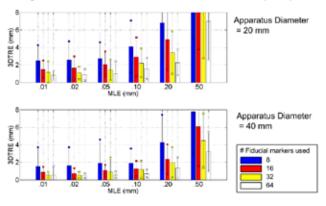

X-ray fluoroscopy (XRF) is considered the primary imaging modality for guidance during cardiac interventions. However, visualization of soft tissue is limited. Image registration between transthoracic echocardiography (TTE) and XRF could potentially be used to fuse soft-tissue imaging with device imaging in minimally sedated patients. We propose a method of XRF/TTE image registration in which a fiducial apparatus is rigidly attached to the TTE probe, and the 3D pose of the fiducial is determined based on its appearance in the XRF image. The fiducial consists of a constellation of radioopaque markers with known geometry. 3D pose estimation accuracy depends on 1) accurate marker localization in the XRF image, 2) geometric properties of the apparatus such as marker diameter, overall apparatus dimensions, marker count, manufacturing tolerances, and 3) pose estimation method. In this work, we performed simulation studies to examine the effect that each variable had on the 3D target registration error (TRE). In the first experiment, we generated simulated XRF images of a spherical marker with varying levels of peak signal-difference-to-noise ratio (pSDNR) and varying marker diameters, and measured the effect on

marker localization error (MLE). In the second experiment, using a circular constellation of markers, we tested the effect that MLE, manufacturing tolerance, apparatus dimensions, marker count, and shape constraints during optimization had on TRE. Our results showed that MLE was roughly 0.14, 0.05, 0.02 mm for pSDNRs of 10, 20 and 30 using a 2 mm diameter spherical marker. TRE decreased as the marker count and apparatus diameter increased. Manufacturing error increased TRE, but had minor effects for clinically relevant levels of MLE. Results indicate that, for a "medium" level of pSDNR (~15), the optimal fiducial configuration can achieve a 3DTRE of 0.32 \pm 0.22 mm, and can achieve a 3DTRE of less than 1.5 mm for noisier images.

Proposed setup for fiducial based TTE/XRF registration.

3D Target Registration Error For Varying Fiducial Apparatus Design Parameters and Marker Localization Errors (MLE)

SP029.6 - Mechanism design a flexible endoscope with USB adaptation to training.

Author(s): <u>Francisco D. Perez Reynoso</u>¹, Daniel Lorias Espinoza¹, Rigoberto Martínez Méndez²

¹Ingeniería Electrica, Centro de Investigación y de Estudios Avanzados del Instituto Politécnico Nacional, Distrito Federal/MEXICO, ²Ingeniería Electrica, Universidad Autónoma del Estado de México, Toluca México/MEXICO

The aim of this paper is to present a mechanism to adapt a boroscopic camera to the operation of a flexible endoscope and get the vision of a real device, leveraging tech-nology for portable devices to provide surgeons the visualiza-tion so important in the training and application of endoscopy, because without this tool is virtually unenforceable. SP029.7 - 3D Quantitative Evaluation System for Integral Photography based 3D Autostereoscopic Medical Display Author(s): <u>Zhencheng Fan</u>, Sen Zhang, Yitong Weng, Guowen Chen, Hongen Liao

Biomedical Engineering, School of Medicine, Tsinghua University, China, Beijing/CHINA

3D autostereoscopic display techniques are used in medicine to assist surgeons to have a better knowledge on regions of interest. However, different 3D image generation algorithms and hardware implementations will bring out varied display quality. An objective and quantitative evaluation of clinical display is necessary. To evaluate the quality of 3D displays, we propose a quantitative evaluation system for 3D autostereoscopic medical display in this paper. The proposed evaluation system is composed of a 3D evaluation reference pattern, a 3D image acquisition platform and a quantitative analysis module. Moreover, we apply an integral photography based 3D autostereoscopic medical display to verify the feasibility and availability of the evaluation system. Based on quantification results of the 3D evaluation reference pattern and the 3D medical image, evaluation errors of the viewing angle, imaging depth as well as image quality are acceptable.

SP030 - Lab-on-chip, BioMEMS and Microfluidics

TRACK 08: BIOSENSOR, NANOTECHNOLOGY, BIOMEMS AND BIOPHOTONICS

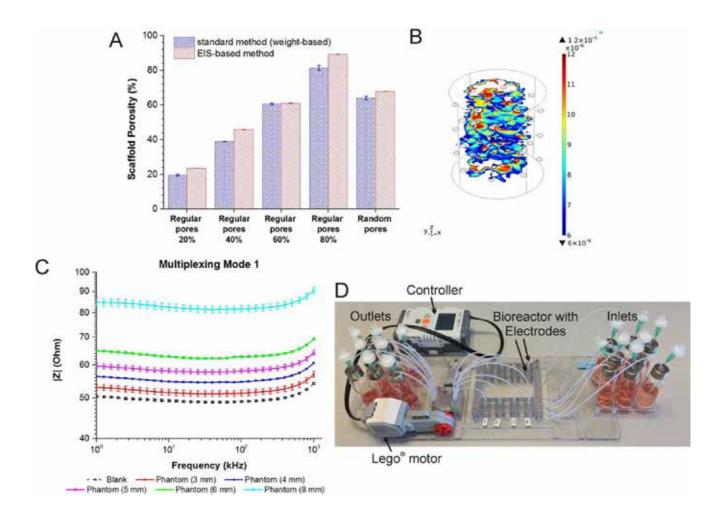

SP030.1 - Drop-based microfluidics for diagnostic applications Author(s):

This talk will introduce the use of microfluidics to control very small aqueous drops that can be used as microreactors to preform millions of experiments in very short times and using very small quantities of reagents. These systems have great potential for use in many research and diagnostic applications. Some of these will be described.

SP030.2 - Enhanced multielectrode configurations in miniaturized 3D electrical impedance spectroscopy and tomography - monitoring the overall process of tissue engineering with spatial sensing for future challenges in microfluidics Author(s): <u>Chiara Canali</u>¹, Haseena B. Muhammad¹, Arto Heiskanen¹, Chiara Mazzoni¹, Lorenzo Ceccarelli¹, Ørjan G. Martinsen², David Holder³, Anders Wolff¹, Martin Dufva¹, Jenny Emnéus¹ ¹Micro- And Nanotechnology, Denmark Technical University, Kgs. Lyngby/DENMARK, ²Physics, University of Oslo, Oslo/NOR-WAY, ³Medical Physics And Bioengineering, University College London, London/UNITED KINGDOM

Over the past two decades, 3D cell culture models have attracted considerable attention to achieve, e.g., in vivo-like structural organization, gene and protein expression, response to stimuli, drug metabolism. A significant challenge in this regard is gaining spatially distributed information when monitoring cell proliferation on a biocompatible scaffold displaying well defined physico-chemical properties. Electrical impedance spectroscopy (EIS) has been shown to be a non-invasive method for biomaterial characterization and monitoring microfluidic cell cultures, gaining an insight on cellular activity and proliferation over time.

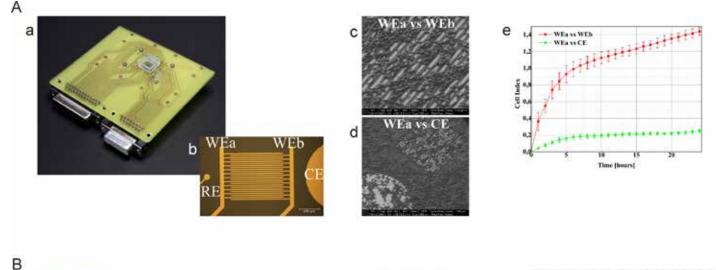

We have developed and validated planar and needle-based multielectrode systems which offer the advantage of switching among different two-, three- and four-electrode configurations to focus impedance-based sensing on specific sub-volumes in a 3D cell culture. Information about scaffold architecture supporting cell organization (e.g. porosity, Fig. 1A), medium conductivity, and 3D spatial distribution of cells can be obtained. Furthermore, four-electrode configurations can also be used for electrical impedance tomography (EIT)-based imaging to map the conductivity distribution within a miniaturized 3D cell culture system (Fig. 1B). Finite element simulations were used to optimize electrode number, spacing and orientation with respect to the bioreactor geometry by maximizing the derived sensitivity field distribution for measurements. Validation with phantom experiments, mimicking cell clusters (Fig. 1C), and cell-based experiments was performed aiming to incorporate spatially enhanced 3D sensing into a 8-channel bioreactor array with integrated microfluidics for real-time monitoring of cell proliferation in porous scaffolds (Fig. 1D). The integration of the developed non-invasive sensing methods enable monitoring of tissue development within otherwise inaccessible areas of a 3D tissue construct, overcoming limitations of more traditional optical techniques.

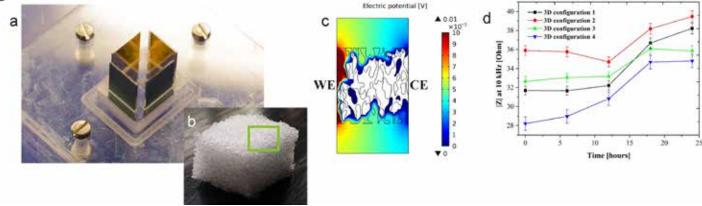

SP030.3 - On-line monitoring of 2D and 3D cell cultures: electrode configurations for impedance based sensors Author(s): <u>Chiara Canali</u>¹, Claudia Caviglia¹, Kinga Zór¹, Haseena B. Muhammad¹, Arto Heiskanen¹, Ørjan G. Martinsen², Thomas L. Andresen¹, Anders Wolff¹, Martin Dufva¹, Jenny Emnéus¹ ¹Micro- And Nanotechnology, Denmark Technical University, Kgs. Lyngby/DENMARK, ²Physics, University of Oslo, Oslo/NORWAY

Electrochemical impedance spectroscopy (EIS) has been proved to be a valuable technique for label-free, real-time and minimal invasive detection of cellular functions in fundamental and applied research. During the last three decades, several two-dimensional (2D) impedance-based systems have been widely used for studying cell adhesion and spreading, proliferation and death. Nowadays, there is an increasing interest towards three-dimensional (3D) cell cultures, which are proposed to create and maintain a more in vivo-like environment. EIS can be applied at different stages when developing a 2D or 3D culture setup, starting from bare scaffold and electrode characterization to monitor cell proliferation and tissue functionality. We present theoretical and experimental comparison of several electrode configurations (or modes) both in 2D (Fig. 1A) and 3D (Fig. 1B) used for following cell growth in real-time. Two different 2D modes were explored measuring between: i) the two combs (working electrode a vs b, WEa vs WEb), interdigitated configuration (Fig. 1Aa,b,c) and ii) WE versus a large counter electrode (CE), conventional "vertical" configuration, and found that the interdigitated configuration provides a higher sensitivity when monitoring HeLa cells adhesion, spreading and growth over 24-h (Fig. 1Ad).

In 3D environment there is a need for adding the third dimension to EIS sensing for spatial resolution to gain information about distribution of cells in the scaffold (Fig. 1Ba,b,c). Moreover, electrode number, geometry and orientation need to be optimized with respect to the deriving sensitivity field distribution. In order to gain information with a good resolution, we show that several two-, three- and four-electrode measurements can be combined to create complementary sensitivity fields which individually focus on specific volumes inside the 3D cell culture and, taken together, cover the whole measurement chamber volume. This approach was tested for growing hepatoblastoma (HepG2) cells embedded within a 5% w/v gelatin scaffold (Fig. 1Bd).

SP030.4 - Development of Microfluidic Paper-Based Electrochemical Immunoassays for the Detection of Prostate Cancer Author(s): <u>Sean P. Rawlinson</u>, Prosper Kanyong, James Mclaughlin, James Davis

Nibec, School Of Engineering, University of Ulster, Newtownabbey/ UNITED KINGDOM

Prostate cancer or carcinoma of the prostate is one of the most frequently diagnosed malignancies in the world. Prostate cancer is the second leading cause of cancer death in men worldwide and the fourth most common cancer overall, with more than 1.1 million new cases diagnosed in 2012, and more than 307,000 deaths from the disease¹. The prevalence of the condition and mortality will clearly vary from one country to another but tends to be higher in developed countries². Prostate cancer incidence is strongly linked to age with the lowest incidence rates being in younger men. In the UK between 2009 and 2011, only 1% of cases were diagnosed in men under 50 and an average of 36% of cases was diagnosed in men aged 75 years and over1. In a population with increasing longevity, it is likely that prostate cancer will become even more clinically prevalent in the future. This projected increase is a major concern for the public health sector, especially when there are both problems associated with the detection and the treatment of prostate cancer. Specifically, current practice in prostate cancer and staging leads to inaccurate assessments often resulting in unwanted or even unnecessary treatments that adversely affect the patient's quality of life with little gain. It will also place a considerable burden on the healthcare provider.

The poster presentation details a new approach to the development of microfluidic paper-based electrochemical devices that will be capable of multiparametric detection. Rather than examining single parameter detection, the strategy adopted here involves the laser machining of cellulose based substrates to create an array of microfluidic channels and detection wells as detailed in Figure 1. Screen printed electrodes are positioned within the wells and can be functionalised with a variety of molecular recognition elements (enzyme or antibody) thereby providing a system which is capable of screening a panel of biomarkers relevant to the diagnosis of prostate cancer. The design, development and bioanalytical characterisation of the prototype sensing systems will be presented and the applicability to point of care diagnosis critically assessed.

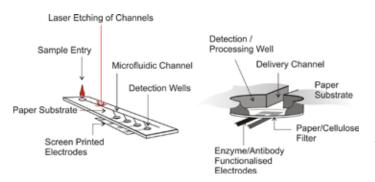

Figure 1. Schematic of the microfluidic array.

SP030.5 - Investigating chip design for a Raman microfluidic system with clinical radiobiological applications.

Author(s): <u>Samantha J. Harder</u>¹, Julian J. Lum², Andrew Jirasek³, Alexandre G. Brolo⁴

¹Physics And Astronomy, University of Victoria, Victoria/CANA-DA, ²Deeley Research Centre, BC Cancer Agency, Victoria/BC/ CANADA, ³Physics, University of British Columbia - Okanagan, Kelowna/BC/CANADA, ⁴Chemistry, University of Victoria, Victoria/ BC/CANADA

Raman spectroscopy (RS) has been demonstrated as valuable for studying biomolecular responses of human cancer cells to clinically relevant doses of ionizing radiation.1 Radioresistance in cancer therapy remains a significant problem and recent studies indicate that RS may provide important biological insight into mechanisms of radioresistance.² Raman microfluidic (RMF) systems offer several potential advantages over traditional single cell Raman data acquisition techniques. The precise control of suspended particles in microfluidic environments facilitate automation of data collection, reducing the time required and user dependence of data acquisition. RMF systems facilitate efficient sample use which is favourable when dealing with small or rare samples- as is the case with patient biopsies. RMF systems have the potential to make RS more accessible for applications in the clinic and for wide-spread radiobiological studies. The objective of this work is to investigate microfluidic chip design for single cell Raman spectroscopic studies in radiobiology.

Three different prototype RMF systems have been investigated, to determine an optimal chip substrate and design. The first system is formed from polydimethylsiloxane (PDMS) using soft lithography techniques.3 This system varied slightly from traditional PDMS microfluidic systems by employing a MgF2 coverslip to seal the system instead of glass. MgF2 exhibits a relatively weak Raman spectrum in the spectral region of interest, compared to most glasses, making it ideal as a substrate material for chip design. Second, a novel RMF design was realized by forming the base and top surfaces of the chip using MgF2 with Parafilm forming the channel walls. Lastly, a novel design made entirely out of MgF2 was tested. A channel was laser etched into MgF2 using a Ti:Sapphire laser, and the system was sealed using a MgF2 coverslip. Raman spectra from single cells in each RMF system have been collected, using a Renishaw inVia Raman microscope coupled with a 785 nm laser, in order to determine the optimal chip design for radiobiological Raman studies.

The PDMS based RMF chip yielded cell spectra which were contaminated by Raman peaks characteristic of PDMS. These peaks interfere with cellular Raman signals in spectral regions which are important for assessing radiation-induced responses in cells.^{1,4} The PDMS chip design is, therefore, unsuitable for radiobiological applications. The novel Parafilm-MgF2 and solid MgF2 chip designs yielded suitable cell spectra for studying radiation-induced biomolecular changes in cells, since in both cases there were minimal contributions from the chip material in the Raman spectra.

Both the novel Parafilm-MgF2 and solid MgF2 chip designs are promising for single cell Raman radiobiological studies. Both systems warrant further investigation as potential designs which may facilitate adaptation of Raman spectroscopy for the clinic and for wide-scale biological research.

SP030.6 - A lab-on-a-chip system for hypoxic investigations on single biological cells

Author(s): <u>Ahmed Alrifaiy</u>¹, Olof Lindahl², Kerstin Ramser³ ¹Neuroscience And Physiology, Gothenburg University - Sahlgrenska Academi, Gothenburg/SWEDEN, ²Centre For Biomedical Engineering And Physics, Umeå University, Umeå/SWEDEN, ³Department Of Engineering Sciences And Mathematics, Luleå University of Technology, Umeå/SWEDEN

Biological investigations during acute and /or long-term hypoxia have become an important key in research that requires extraordinary experimental design. We present a platform of a multifunctional lab-on-a-chip (LOC) system for hypoxic investigation on biological single cells with controlled oxygen content and surroundings. The LOC was combined with the patch clamp technique for electrophysiological investigations, optical tweezers for manipulation of the individual cells in 3D within the closed micro-channel system, absorption spectroscopy to monitor and acquire the spectral response of the cells to different oxygenated states and oxygen sensor to monitor the oxygen level within the chip. All techniques was built on an inverted microscope (IX71, Olympus, Japan), on a vibration free optical table (Figure 1A). The developed gastight LOC in Plexiglas with an integrated patch-clamp micropipette (Figure 1B) is aimed to replace the open system in conventional patch clamp technique to achieve control of the gaseous surroundings of the investigated cells. To test the system, a single red blood cell (RBC) from Chicken (Fitzgerald Industries International, USA) was trapped optically, moved in 3D through the micro-channels of the chip towards the integrated micropipette within the gastight chip. The oxygen levels dissolved in the extracellular solution within the micro-channels was monitored by an oxygen sensor (FOXY, AL3000, Ocean Optics, USA) reached values between 0-18% O2 which was verified by studying the oxygenation states of the trapped RBC with UV-Vis absorption spectra (Ocean Optics, HR4000, USA) simultaneously, (Figure 1C). The spectral transfer of the investigated cell from the oxygenated state (18% O2) to the deoxygenated state (0% O2) happened after about 3,7 minutes while a fully developed deoxygenated spectrum was observed after 4.9 minutes. The gas tightness of the hypoxic chamber to the oxygen diffusion was verified by stopping the flow of deoxygenated solution into the channel system while continuously recording UV-Vis spectra, showing an unchanged deoxygenated state during 90 min. Thereafter, a transfer to the oxygenated absorption spectra was achieved after 7.1min when exposing the cell to normoxic buffer solution. The result above showed the long time viability of the investigated cells as well as the control of the hypoxic conditions within the chip. To verify the system for physiological investigations, successful patch clamp investigations (EPC-7, HEKA, Germany) on a trapped RBC were established and the whole-cell access (Ra) and membrane resistances (Rm) were measured to be 5.1 M Ω and 900 M Ω respectively.

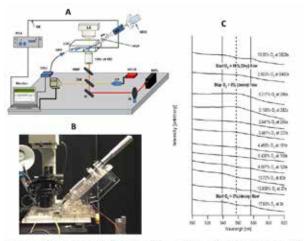

Figure 1: A. Schemstie figure of LOC system including all techniques, B. LOC system integrated with patch Clamp technique, C. Absorption spectra of optically supped chicken RBC with measured oxygen levels and time scale.

SP030.7 - Gas Sensors with ZnO Quantum Dots Synthetized by Sol-Gel Methods

Author(s): Glécia V.D.S. Luz¹, Pedro H.D.O. Nogueira¹, Eduardo C.D. Araújo¹, Luiza C.D. Araújo¹, Pilar Hidalgo¹, <u>Lourdes M. Brasil²</u> ¹University Of Brasília At Gama (unb-fga)/nanotechnology Laboratory, University of Brasília, Brasília/BRAZIL, ²Post-graduation Program In Biomedical Engineering, University of Brasília, Gama/BRAZIL

Nanoparticulate semiconductor materials have unique properties and the elucidation of these have led to interesting discoveries in various fields of science and technology. The number of scientific publications has increased in the last decade on ZnO nanostructures and their potential applications. ZnO is used in a number of biomedical applications such as: glucose detection, gas sensors, wound healing and dental filling materials, macrophage adhesion, coating antibodies which identify specific receptors found on cancer cells, improving the dispersion of light in endoscopic techniques, in the formation of electroluminescent and photovoltaic devices, among others. Nanostructures are defined as having at least on dimension between 1 to 100 nm, with peculiar properties and applications, different from their bulk counterparts. ZnO nanostructures and their potential applications has been the focus of many scientific publications in the last decades. ZnO Quantum dots (QDs) are zerodimensional (0D) structures with great interest of researchers since the 90s and keeping in view the guantization of electron energies in crystals and their transport properties. We studied the effective answers of chemical sensors made from ZnO nanoparticles, synthetized by Sol-Gel Method, for chloroform and ammonium vapors, very present in air conditioner, medical environments and beauty products, for example. These vapors are not toxic at low concentrations, but their increase can cause many health hazards to humans and animals. The results showed that ZnO Sol-Gel QDs sensor demonstrated, apparently, sensitivity to ammonia and no reaction with chloroform vapor. It was evidenced that applicability of nanosensors consisting of ZnO nanoparticles, specifically ZnO quantum dots, for the detection of ammonia vapors present, for example, in environments that may be harmful to human health. It was noted that the detection process of adsorption/release of ammonia vapors is reversible. Thus, there is a need for further testing with this type of sensor in order to check their behavior when exposed to high gas concentrations, and the change of the thickness of the nanoparticle film applied on the substrate. Furthermore, tests should be conducted including different crystallite sizes and structures, mainly seeking their application in several areas of Biomedical Engineering.

SP031 - Pattern Classification

TRACK 09: BIOSIGNAL PROCESSING

SP031.1 - The Recognition of Pinch-to-Zoom Gesture Based on Surface EMG

Author(s): Jongin Kim¹, Dongrae Cho², Kwang Jin Lee¹, Boreom Lee¹ ¹Department Of Medical System Engineering, GIST, Gwangju/KO-REA, ²Mechatronics, gwangju institute of science and technology, Gwangju/KOREA

I. INTRODUCTION

In recent years, a lot of researchers have tried to construct the system to recognize a hand or finger gesture based on the surface electromyogram (sEMG) since it can be used for the human computer interface.

They have only focused on recognizing simple movements such as an extension or flexion of fingers. However, in our present study, we propose a system to recognize a pinch-to-zoom gesture in real-time for practical applications. Pinch-to-zoom is a gesture to change the distance between the thumb and index fingers in order to control the size of images. For inferring the gesture, sEMG was acquired from the first dorsal interosseous muscle and multiclass classification techniques were used.

II. METHODS

A. Experiment and System settings

We recruited six healthy subjects for our experiment. We asked subjects to maintain the distance between thumb and index finger according to the visual cues (0 cm, 4 cm, 8 cm, and 12 cm).

Our system is divided into a sensor interface and computational unit parts. The sensor interface wirelessly transmits the sEMG to computational unit using Bluetooth. We developed graphic user interface (GUI) based on Matlab. The software reduces the noise, extracts the features and provides a visualization of the distance between the thumb and index finger in real time. (See figure1)

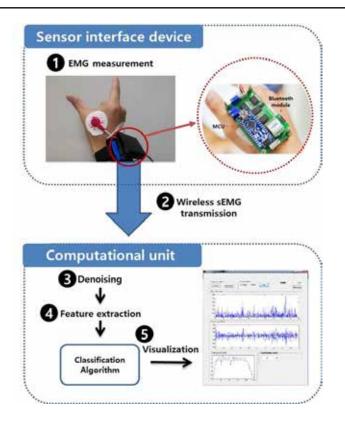

B. Feature extraction and Classification

In order to identify the distinct frequency bands, ANOVA test was conducted between four experimental conditions. Consequently, the powers from 1Hz to 250Hz are statistically significant (p < 0.01). Therefore, the powers from 1Hz to 250Hz were used as features for pinch-to-zoom gesture recognition.

The support vector machine (SVM) was used for recognizing the pinch-to-zoom gesture. Several hyperplanes have to be used for solving an N-class problem (N > 2) because SVM is based on two-class classification. Therefore, One-versus-One strategy was used for recognizing the pinch-to-zoom gesture.

III. RESULTS

We obtained sEMG data for a total of 400 trials per subject in order to prove the utility of our system, and divided all the data into training and test set. The classifier was constructed using only the training set. In order to accurately estimate the performance of our system, this procedure was repeatedly conducted ten times with different random partitions. As a result, average classification rate over all subjects was about 91.9%. These results prove that our system can be successfully used for recognizing the pinch-to-zoom gesture in real time.

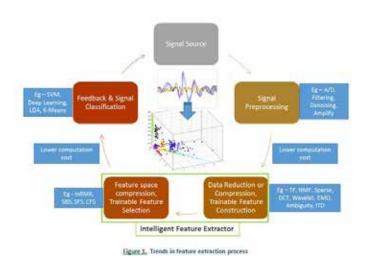

SP031.2 - Feature extraction trends for biomedical signals Author(s): <u>Yashodhan Athavale¹</u>, Sridhar Krishnan²

¹Electrical & Computer Engineering, Ryerson University, Toronto/ ON/CANADA, ²Electrical & Computer Engineering, Ryerson University, Toronto/CANADA

Signal analytics involves identifying signal behavior, extracting linear and non-linear properties, compression or expansion into higher or lower dimensions, and recognizing patterns. Over the last few decades, signal analytics has taken notable evolutionary leaps in terms of measurement – from being simple techniques for analyzing analog/digital signals in time/frequency/joint time-frequency (TF) domain, to being complex techniques for analysis in a higher dimensional sparse domain. The intention behind this is simple – Feature Extraction; i.e. to identify specific signal markers or properties exhibited in one phenomenon, and uses them to distinguish from properties exhibited in another phenomenon [1-9].

One must realize that real world biomedical signals are non-linear, non-stationary and could comprise of multi-modal components. Evolutionary methods such as Autoregressive modeling, Cepstrum modeling, and Fourier and Wavelet analysis can handle non-stationarity through windowing approaches [7, 9], but with certain limitations such as information loss, lower artifact filtering and low signalto-noise & distortion-ratio (SNDR). We suggest that modern day feature extraction methods must be as intelligent and trainable as the pattern classifier itself. Ideally instead of windowing, it is recommended to handle real-time signals using a streaming or on-the-fly approach, i.e. extract features as the signal propagates through the source. This could be made possible by employing newer sparse and compressive sensing approaches in combination with TF methods such as non-negative matrix factorization; or even a deep learning network constructed using a cascade of wavelet filters. An intelligent feature extractor could possibly eliminate the need for a feature selection technique (such as mRMR - minimum redundancy maximum representation), as this would happen inherently within the feature extractor. Additionally if the features are visually separable between signal classes, then employing a simple linear classifier could reduce system design constraints thus impacting the hardware design positively. Through this study we are attempting to

determine the best combination of signal processing methods which could generate an intelligent feature extractor capable of: [i] robustness to artifacts, [ii] improving SNDR, [iii] handling non-linearity, [iv] handling non-stationarity, [v] assessing signal component variability, [vi] addressing higher dimensionality of feature space by compact or sparse feature generation, and most importantly [vii] generating a feature set which brings out maximum representation of the signal and helps pattern classification. From a hardware perspective we should also include the following criterion: [i] built-in pre-processing and artifact removal, [ii] low power and memory consumption, [iii] real-time signal processing capability and [iv] computationally cost effective.

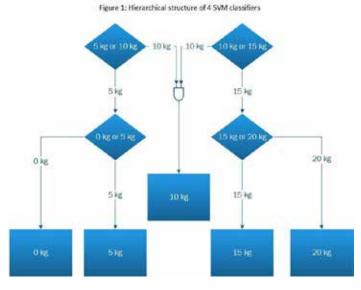

SP031.4 - Classification of Load in Hands Based on Upper Limb SEMG

Author(s): Illya Seagal, Evelyn Morin Electrical & Computer Engineering, Queen's University, Kingston/ ON/CANADA

The purpose of this study is to correctly classify load lifted during a pail lift task. Surface EMG (SEMG) data were recorded from six locations on the arm and trunk of 15 subjects. Each subject was asked to lift a pail with one hand onto a platform at waist height in front of him/her. The pail contained masses from 0 kg to 20 kg in increments of 5 kg. Each weight was lifted and set down 5 times.

The down-lift interval of the task was identified from a recording of an electro-mechanical switch and SEMG data from the triceps brachii and brachioradialis were extracted. The data were filtered for noise reduction using a 12thorder high pass Type II Chebyshev filter with a cut-off frequency of 25 Hz, and a low pass 1st order Butterworth filter with a cut-off frequency of 490 Hz. The mean absolute value (MAV) and RMS value were computed and used as a feature set. A hierarchical SVM system shown in Figure 1 was used to classify the load lifted.

Overall the mean inter-subject classification success rate for classifiable trials was 0.490 using a train on 1st subject and test on others scheme, and 0.483 using a train on 1st trial and loads of all subjects and test on all other trials scheme. The combined confusion matrix for the former scheme can be seen below. Using simple features and a hierarchical SVM structure, a reasonable inter-subject classification accuracy was achieved. This outcome may be improved in the future by careful selection of additional features.

SP031.3 - A Hybrid Model for Diagnosing Sever Aortic Stenosis in Asymptomatic Patients using Phonocardiogram

Author(s): Arash Gharehbaghi¹, Per Ask², Eva Nylander³, Birgitta Janerot-Sjoberg⁴, Inger Ekman³, <u>Maria Lindén¹</u>, Ankica Babic² ¹Department Of Innovation, Design And Technology, Mälardalen University, Västerås/SWEDEN, ²Department Of Biomedical Engineering, Linköping University, Linköping/SWEDEN, ³Department Of Clinical Physiology, Linköping University, Linköping/SWEDEN, ⁴Department Of Clinical Science, Intervention And Technology, Karolinska Institutet, Stockholm/SWEDEN

This study presents a screening algorithm for severe aortic stenosis (AS), based on a processing method for phonocardiographic (PCG) signal. The processing method employs a hybrid model, constituted of a hidden Markov model and support vector machine. The method benefits from a preprocessing phase for an enhanced learning. The performance of the method is statistically evaluated using PCG signals recorded from 50 individuals who were referred to the echocardiography lab at Linköping University hospital. All the individuals were diagnosed as having a degree of AS, from mild to severe, according to the echocardiographic measurements. The patient group consists of 26 individuals with severe AS, and the rest of the 24 patients comprise the control group. Performance of the method is statistically evaluated using repeated random sub sampling. Results showed a 95% confidence interval of (80.5%-82.8%) / (77.8% - 80.8%) for the accuracy/sensitivity, exhibiting an acceptable performance to be used as decision support system in the primary healthcare center.

Table 1: Combined confusion matrix for all trials and subjects where the classifier was trained using data from subject 1, and tested on all other subjects. Some trials could not be classified due to poor electro-mechanical switch data.

SP031.5 - An Intelligent Method for Discrimination between Aortic and Pulmonary Stenosis using Phonocardiogram

Author(s): Arash Gharehbaghi¹, <u>Amir A. Sepehri</u>², Armen Kocharian³, Maria Lindén¹

¹Department Of Innovation, Design And Technology, Mälardalen University, Västerås/SWEDEN, ²CAPIS Biomedical Research and Department Center, Mons/BELGIUM, ³Department Of Pediatrics, Tehran University of Medical Sciences, Tehran/IRAN

This study presents an artificial intelligent-based method for processing phonocardiographic (PCG) signal of the patients with ejection murmur to assess the underlying pathology initiating the murmur. The method is based on our unique method for finding disease-related frequency bands in conjunction with a sophisticated statistical classifier. Children with aortic stenosis (AS), and pulmonary stenosis (PS) were the two patient groups subjected to the study, taking the healthy ones (no murmur) as the control group. PCG signals were acquired from 45 referrals to the children University hospital, comprised of 15 individuals of each group; all were diagnosed by the expert pediatric cardiologists according to the echocardiographic measurements together with the complementary tests. The accuracy of the method is evaluated to be 90% and 93.3% using the 5-fold and leave-one-out validation method, respectively. The accuracy is slightly degraded to 86.7% and 93.3% when a Gaussian noise with signal to noise ratio of 20 dB is added to the PCG signals, exhibiting an acceptable immunity against the noise. The method offered promising results to be used as a decision support system in the primary healthcare centers or clinics.

SP032 - Neural Interfaces and Regeneration

TRACK 11: NEUROENGINEERING, NEURAL SYSTEMS

SP032.1 - NEUROPROSTHETIC SYSTEMS FOR ENHANCEMENT OF NEUROPLASTICITY FOLLOWING STROKE AND SPINAL CORD INJURY

Author(s): Milos Popovic

Toronto Rehabilitation Institute, University Health Network, Toronto/ CANADA

In this lecture three neuroprosthetic applications will be presented that do not belong to a typical "garden variety" neuroprostheses that one can commonly find discussed in the literature. The first part of the lecture will showcase a neuroprosthetic application, which is aimed at restoring voluntary hand function after severe stroke. In the lecture the results of a Phase II randomized control trial will be presented, which were pivotal for this technology to become a commercially viable product. The second part of the lecture will discuss a neuroprosthetic system for blood pressure regulation for individuals who suffer from orthostatic hypotension following spinal cord injury. In the lecture the results from a Phase I clinical trial will be presented. The third part of the lecture will showcase use of electrical stimulation technology as means to navigate stem cell migration. In the lecture the proof of principle results will be presented. These three project have been selected to showcase idea generation, product development and clinical trial validation process commonly practiced at the Rehabilitation Engineering Laboratory. The second objective of this lecture is to stress the importance of system level engineering, as a critical tool in the process of creation, development and validation of neuroprosthetic devices.

SP032.2 - Demonstration of Graphene Microelectrodes as a Bioelectronic Interface

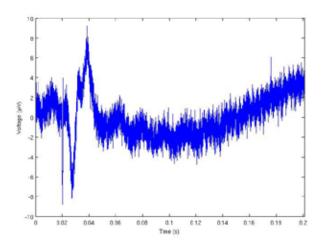

Author(s): Michael R. Horn¹, Arika D. Kemp¹, Keong H. Yong², Jonghyun Choi², Sungwoo Nam², Ken Yoshida¹ ¹Biomedical Engineering, Indiana University Purdue University Indianapolis, Indianapolis/IN/UNITED STATES OF AMERICA, ²Mechanical Science And Engineering, University of Illinois at Urbana-Champaign, Urbana/IL/UNITED STATES OF AMERICA

In the past 15 years, our lab has developed intrafascicular microelectrode arrays (MEAs) for use in the peripheral nerve based upon micropatterened polyimide substrates with metal traces and contacts. These were the thin-film Longitudinal Intra-Fascicular Electrode (tfLIFE) and the Transversely Implanted Micro-Electrode array (TIME). Acutely, these electrodes provide a high resolution view of the nerve activity within a nerve fascicle as well as a high resolution means to activate subsets of the nerve bundle. In part, the use of polyimide as the substrate material was to reduce the mechanical property mismatch between the neural tissues and the electrode structure as a means improve the chronic viability of the neural interface. However, chronic implants of tfLIFE and TIME structures have shown that despite being several orders of magnitude softer than metal wire electrodes, (~1GPa vs ~150 GPa), the structures became encapsulated in a similar fashion to the metal wire electrodes. It has become clear that the 2 orders of magnitude reduction in modulus was not a sufficiently large enough reduction to show a change in encapsulation of the electrodes in the peripheral nerve, which has a modulus of elasticity of ~100kPa.

We are currently exploring newer softer materials for the substrate, with moduli on the order of 1GPa. However, substrates of softer materials will require traces and contacts that can withstand 10-15% elongation. This pilot study, we explored such a material, graphene.

Analysis of whether a graphene microelectrode array could measure the bioelectrical activity of muscle tissue as a first step towards developing a general purpose ultra-

flexible neural or muscular bioelectric interface. A graphene MEA (graMEA) was placed on the surface of an ex vivo rat biceps femoris muscle, and the electrical activity resulting from electrical stimulation of the sciatic nerve was recorded. The resulting twitch activity was simultaneously recorded using conventional intramuscular wire electrodes. It was found that the graMEA was capable of measuring stimulus artifact, compound EMG of the twitch and mechanical movement of the muscle, as shown below. Further advancements to the graphene based electrode include increasing the surface area by crumpling, reducing the contact size to increase spatial resolution of small nerve fibers, and using a field-effect transistor (FET) mode to increase signal to noise ratio. The results of this study provide proof of concept that flexible graphene electrodes can transduce bioelectrical activity of bioelectrically active tissues, opening the way towards developing ultra-small, ultra-flexible bioelectric interfaces.

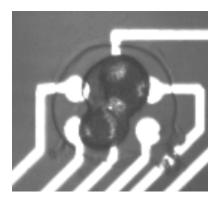

SP032.3 - Development of a planar microelectrode array offering long-term, high-resolution neuronal recordings Author(s): <u>Pierre J.J. Wijdenes</u>¹, Colin Dalton², Ryden J. Armstrong³,

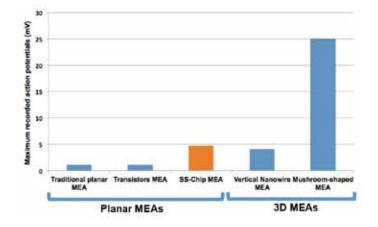

Wali Zaidi³, Naweed Syed³ ¹Biomedical Engineering Program, University of Calgary, Calgary/ AB/CANADA, ²Department Of Electrical And Computer Engineering, University of Calgary, Calgary/CANADA, ³Faculty Of Medicine, University Of Calgary, Hotchkiss Brain Institute, Calgary/CANADA

All nervous system functions, ranging from simple reflexes to learning and memory, rely on networks of interconnected brain cells called neurons, which initiate and convey electrical information. Monitoring neuronal activities of a large neuronal ensemble, noninvasively and over an extended time period, is pivotal for understanding all brain functions. A variety of neuro-electronic interfaces now allow monitoring of neuronal and ion channel activities. These neuronal monitoring devices are however limited vis-à-vis their efficacy, fidelity and longer-term recording capabilities. Here we report on a novel microelectrode array that allows the detection and characterization of neural activity from individual cells and networks, over long periods of time with a higher signal-to-noise ratio than commercially available devices.

Our in-house development of planar microelectrode arrays has focused on modifying design parameters and fabrication techniques to improve their performance. One such device, the Soma-Soma Chip (SS-Chip), allows us to record activity from single and paired

cells (pre- and post-synaptic neurons, Figure 1) continuously over extended periods of time with a signal-to-noise ratio higher than similar standard devices (Figure 2). This allows for the analysis of neural activity, which can help to characterize firing patterns of neurons at various developmental-stages. Of particular importance is the precise "signatures" of neuronal firing pattern that offers a unique opportunity to decipher how neuronal activity influences brain network connectivity. Our data underscores the importance of further development of novel planar microelectrode array technologies and suggests that there is still work to be done to improve their signal-to-noise ratio. The ability to conduct long-term recordings should also not be considered optional, as this is critically important for fundamental and clinical neuroscience research. These developments will provide novel tools and open new research opportunities critical for understanding the fundamental cellular and network properties underlying network activity under both normal and disease conditions.

SP032.4 - Morphological changes in photoreceptors due to DC electric field

Author(s): Juliana M. Guerra¹, Cora Rohlecke², Richard Funk², Sérgio S. Mühlen¹

¹Biomedical Engineering Departament, UNICAMP, Campinas, SP/ BRAZIL, ²Anatomy Department, Technische Universitat Dresden, Dresden/GERMANY

Previous studies and experimental evidences suggest an important role for endogenous electric fields in directing cell migration in wound healing, cell development and regeneration. In cultures, applied direct current electric field (dcEF) influences cell division, polarity, shape and motility. Photoreceptors dystrophies are one of the major causes of inherited blindness in the western world; application of EF could be used as a cue to direct photoreceptors cells to growth towards the damaged tissue, apart from the possibility of regeneration of the outer segments. In this study we investigate the

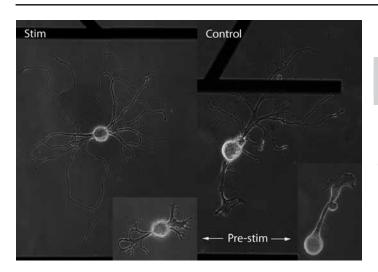

effects of dcEF in the establishment of photoreceptor cell polarity and polarization of intracellular structures, to analyze the special role of an extracellular electrical cue. Using a well established migration assay, photoreceptors cone-like 661W mouse retina cells were stimulated for 5 h with 5 VDC/cm electric field. Using immunofluorescence techniques we have investigated changes in position of important organelles like Microtubules Organizing Center (MTOC), Golgi Apparatus (GA) and nucleus within those cells after the stimulation. In response to the directional stimulus, the cells have extended membrane protrusions towards the cathode; they got elongated perpendicular to the dcEF and have formed a leading edge towards the direction of cues. Directional migration has occurred towards cathode. MTOC and GA were reoriented in the direction of the leading edge of the cells (cathode), while the nucleus was translocated to the back of the cells, in the rear edge. Nuclear positioning is determined by microtubule and actin networks. The Golgi complex was colocalized with the MTOC in order to facilitate polarized secretion and provide membrane and secreted products directly to the most proximate plasma membrane to the leading edge of migrating cells.

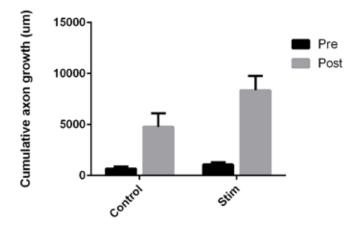

SP032.5 - Accelerating Neurite Outgrowth Through Electric Field Manipulation

Author(s): <u>Michael T. Purdy</u>¹, Pierre J.J. Wijdenes¹, Wali Zaidi², Naweed Syed², Colin Dalton³

¹Biomedical Engineering Program, University of Calgary, Calgary/ AB/CANADA, ²Department Of Anatomy And Cell Biology, University of Calgary, Calgary/CANADA, ³Department Of Electrical And Computer Engineering, University of Calgary, Calgary/CANADA

Brief electrical stimulation accelerates neuronal regeneration both in individual cells and in living models. In vitro experiments facilitate further understanding of regeneration mechanisms, and stimulation is accomplished through current-injecting micropipettes or commercially available microelectrode arrays. Such stimuli can be approximated as point-sources that emit decaying electric fields with high magnitude field strength near the electrode or micropipette. However, uniform electric fields may be better suited to enhance growth than traditionally used point-source fields. Applied uniform electric fields would allow for long distance stimulation without requiring high voltages that can compromise electrode integrity and cell health. The viability of uniform electric field stimulation was explored in this study through the use of a custom-fabricated planar microelectrode array. Simulation of several electrode configurations resulted in the design of a parallel plate anode-cathode pair. Several electrode pairs were embedded onto a single microelectrode array at various gap widths, to allow for the study of electric field strength on overall growth. With this novel electrode array, individual Lymnaea snail cells were stimulated with a 20 Hz, 1 volt pulse train for one hour. Control cells were plated on identical electrode arrays but were not connected to the stimulus generator. The impact of stimulation on growth was measured 24 hours later, and compared to control groups (Fig. 1). Stimulated cells showed an increase in overall neurite length compared to controls (Fig. 2). This effect was seen regardless of stimulus magnitude, within the range of 1000 - 2000 mV/mm. Our preliminary study served as a proof of principal for the application of uniform electric fields as a regenerative technique for nerve regrowth. The designed electrode layout improves upon currently available microelectrode arrays, and will allow for further study of regeneration mechanisms. This layout will be more easily transferred to an implantable design for future clinical use.

SP033 - Imaging: Part 1

PRESIDENTS CALL

SP033.1 - Quantification of breast density using dual-energy mammography, CT and MRI

Author(s): <u>Sabee Molloi</u>, Huanjun Ding Radiological Sciences, University of California, Irvine/UNITED STATES OF AMERICA

Breast cancer is the most common cancer and the second leading cause of death from cancer. Mammographic density, which is defined as the ratio of fibroglandular tissue to the total fibroglandular and adipose tissue, is an important risk factor in the development of breast cancer. It has been shown that women with the highest mammographic density (75%-100% fibroglandular volume) have four- to fivefold increased risk of developing breast cancer compared with the lowest density (0%-25% fibroglandular volume). The current standard of care for breast density evaluation involves visual assessment of mammograms. This subjective classification scheme is limited by its considerable intra- and inter-reader variability. Additionally, an important limitation is that an area measurement using mammography ignores the physical 3D character of a real breast. Breasts of different thicknesses can potentially all yield the same measurement of area breast density yet correspond to widely varying volumetric breast density values. Volume-based techniques, which overcome some of the limitations of area-based techniques, include using dual-energy mammography, CT and MRI. Currently, there is no accepted standard for measuring breast density and accuracy of different techniques is not known. Postmortem breast studies were performed to assess the accuracy of breast density measurement for dual-energy mammography, spectral CT, dualenergy cone-beam CT, cone-beam CT and MRI. 40 postmortem breasts were imaged using a dual-energy mammography system. Glandular and adipose equivalent phantoms of uniform thickness were used to calibrate a dual-energy basis decomposition algorithm. Dual-energy decomposition was applied after scatter correction to calculate breast density. Breast density was also estimated using percent volumetric measures described in BI-RADS, standard histogram thresholding and a fuzzy C-mean (FCM) algorithm. The postmortem breasts were also imaged using spectral CT based on CZT photon-counting detectors, dual-energy cone-beam CT and breast MRI. Finally, breasts were chemically decomposed to measure the definitive tissue composition, in terms of water, lipid, and protein. The left-and-right correlations were used to estimate the precision of each technique. The percent fibroglandular volume (%FGV) from chemical analysis was used as the reference standard to assess the accuracy of different techniques to measure breast composition. In the left-and-right comparisons, the standard error estimation (SEE) was calculated to be 9.1%, 9.1%, 9.2% and 4.6% for BI-RADS, standard histogram thresholding, FCM, and dualenergy mammography, respectively. In correlation to %FGV from chemical analysis, SEE was calculated to be 9.9%, 8.6%, 7.2% and 4.7% using guartile volumetric rankings, standard histogram thresholding, FCM, and dual-energy mammography, respectively. The accuracy of breast density measurement for spectral CT, dualenergy cone-beam CT, cone-beam CT and MRI were calculated to be 2.8%, 3.6%, 3.9%, and 6.5%, respectively. In conclusion, the results indicate that dual energy mammography can be used to accurately measure breast density. The variability in breast density estimation using dual energy mammography was substantially lower than quartile volumetric rankings, standard histogram thresholding, FCM and breast MRI. The results also suggested that spectral CT is a very promising technology for breast imaging.

SP033.2 - Study on the Main Nonconformities Found in no Mammography Alagoas State

Author(s): Jose R. Almeida Neto¹, Cinthia M.M. Paschoal², Divanizia D.N. Souza³, Lourdes M. Brasil⁴, <u>Fernanda C.L. Ferreira⁵</u> ¹Phsysics, State University of Health Sciences of Alagoas, Alagoas/ BRAZIL, ²Civil Engineering, State University of Vale do Acarau, Sobral/BRAZIL, ³Phsysics, Federal University of Sergipe, São Cristovão/BRAZIL, ⁴University of Brasilia, Brasília/BRAZIL, ⁵Federal University of South and Southeast of Pará,, Marabá/BRAZIL

Mammography is one of the most important radiological techniques in tracking and control of the breast cancer development; capable to accurately identify the absence or presence of diseases, which can assist in the definition of reliable reports in case of viewing any types of anomaly. In this sense, the aim of this work was to conduct a study of the major non-conformities found in mammograms operating in the State of Alagoas, Brazil, warning the risk of negative and false positive diagnosis. In this work, main non-conformities found in the mammography's equipment of the state are prioritized, such results were classified as compliant and non-compliant according to the guidelines established by the National Agency for Sanitary Vigilance Manual, published in 2005. the tests in mammograms showed that a higher percentage of non-compliance were A1, B2 and B5, as well, may be recommended that the mammography equipment such institutions should undergo maintenance process and rigorous calibration and frequent quality control tests. Mammograms' tests A3, A4 and B1 showed satisfactory results, with compliance above 90% within the parameters established by Decree 453 of National Agency for Sanitary Vigilance. Focusing on all mammograms, it becomes necessary to implement a quality control program

SP033.3 - Affordable medical x-ray imaging for the developing world: a global vision

Author(s): <u>Sorin Marcovici</u>¹, Vlad Sukhovatkin², Oscar Cisek² ¹XLV DIAGNOSTICS INC., Thunder Bay/CANADA, ²XLV DIAGNOS-TICS INC, Thunder Bay/ON/CANADA

Imaging technologies, already used routinely for diagnostics, are becoming an essential part of the work flow included in screening, treatment progress monitoring and outcome evaluation. However, various imaging modalities considered standard practice for the medical institutions in the developed world remain today rather inaccessible for the populations at large in the developing countries. One of the limiting factors is the high cost of medical imaging equipment.

To develop and produce low cost, medical imaging systems of good quality requires disruptive innovations and novel approaches to engineering. The sophistication and capabilities of ubiquitous consumer products available today provide a real opportunity to capitalize on their low cost components to drive down significantly the cost of medical imaging equipment.

Following this approach, XLV Diagnostics, a Canadian start-up, is developing a completely new technology, X-ray Light Valve (XLV), for producing very affordable large area, flat panel, x-ray detectors based on which economical medical imaging systems can be built. The first XLV product will be a digital mammography machine for breast cancer screening that will be sold at a fraction of the price asked for presently available machines.

The paper will present the conceptual approach and innovative engineering to create from consumer type components a good quality digital imaging system and will show several of its parametric characteristics.

SP033.4 - Characterization and Analysis of the Physical Parameters in Dental X-Rays Phantom

Author(s): Lilian F. Silva¹, Jhonatan M. Santos¹, Cinthia M.M. Paschoal², Divanizia D.N. Souza³, Lourdes M. Brasil⁴, <u>Fernanda C.L.</u> <u>Ferreira¹</u>

¹Federal University of South and Southeast of Pará,, Marabá/BRA-ZIL, ²Civil Engineering, State University of Vale do Acarau, Sobral/ BRAZIL, ³Phsysics, Federal University of Sergipe, São Cristovão/ BRAZIL, ⁴University of Brasilia, Brasília/BRAZIL

All care related to ionizing radiation exposure to patients, the radiographic image guality and gain time is related to guality control equipment and image. Therefore, it is necessary to be realized by using quality control and intercomparison phantom images with the results of previous tests as well as other types of X-ray equipment, or performing the intercomparison of results of quality control testing. The objective of this study was to characterization, and analysis (intercomparison) results periapical radiographs obtained with phantom and evaluate the high and low contrast in dental radiographs service of Maraba, northern Brazil. For the intercomparison of physical parameter of high and low contrast in the periapical radiographic equipment of the Maraba, a phantom developed in Brazil was used precisely in Aracaju, northeastern. It is worth noting that, the phantom used in this work and the interparameter of the equipment of the images showed satisfactory results bringing out the difference from the standard image. However, tests can be used to switch to other equipment in the surrounding towns of the city of Maraba. Thus allowing the cornerstone for the creation of a database with images obtained with the phantom and can be used in training of students and dental professionals.

SP033.5 - In Vitro and In Vivo Studies Glycosylated Gadolinum Nanomagnetic Particleas (GD-DTPA-DG) as New Potential Metabolic Contrast Agent in MMRI

Author(s): Sara -. Heydarnezhadi, <u>Nader Riyahi-Alam</u>, Soheila Haghgoo, Ensieh Gorji, Hosein Ghenaati, Behrouz Rafiei Tehran university of Medical Science, tehran/IRAN

Early cancer diagnosis using MRI imaging is of high global interest as a noninvasive and powerful modality in molecular Imaging. Therefore demand for new MRI contrast agents, with an enhanced sensitivity and advanced functionali-ties that improve the targeting to specific tissues or organs, is very high. in thise study, D-glucose amine was conjugated to a well-known chelator, diethylenetriamine penta-acetic acid (DTPA), then labeled with Gd to achieve Gd-DT-PA-DG, Which is a metabolic contrast agent in mMRI. The contrast agent was synthesized and characterized physicochemical using different techniques including dynamic light scattering (DLS), high resolution transmission electron microscopy (HTEM) and inductively coupled plasma atomic emission spectroscopy (ICP-AES). Efficacy of the targeted contrast agent was assessed by measuring relaxation rate in vitro and tumor MR imaging were performed to determine signal inten-sity (SI) in vivo (0.1 mmol Gd/kg) in female balb/c mice mod-el. According to the results, the nano metabolic contrast agent penetrate into cells and accumulated in tumor, which cause improve the contrast of tumor tissue in comparison with magnevist. The results showed that the novel nano contrast agent could become useful tool in early detection of cancer

SP034 - CT: New Techniques

TRACK 01: IMAGING

SP034.1 - Design, modeling and performance evaluation of a small animal Micro-CT scanner: A Monte Carlo study Author(s): Samira Nezhaddehghani, Saeed Sarkar, <u>Mohammad</u> <u>Reza Ay</u>

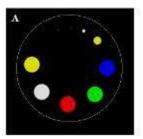

Department Of Medical Physics And Biomedical Engineering, Tehran University of Medical Sciences, tehran/IRAN

Introduction: Nowadays, by increasing the interest in the use of small animals in biomedical studies, development of small animals imaging systems such as Micro-CT scanners are promoted. Development of the hybrid systems such as SPECT/CT is the other significant factors in development of this kind of scanners. The diagnostic power will be increased by superposition anatomical and functional images in hybrid systems. Furthermore, obtained attenuation map from Micro-CT can be used for attenuation correction of the SPECT data. The purpose of this study was to design and improves the performance of Micro-CT scanner to develop a small animal SPECT/CT system by using the Monte Carlo simulation. The SPECT module called HiReSPECT already fabricated in our Laboratory.

Materials and Methods: In this study the GATE Monte Carlo package was used for accurate modeling of the system, the tube voltage 30-70 kV with focal spot size 30 µm, anode from Tungsten and aluminum filter with thickness of 0.5 mm. The designed detection system has dimension $5.0 \times 18.5 \times 4.7$ cm³ with 100 microns pixels size and an indirect flat-panel scintillator made from CsI(TI). In this study, the selected distance from the X-ray tube to object 10-12 cm and distance from object to detection system 8-10 cm was considered. These distances were chosen base on the separation length between two detectors and diameter of gantry of HiReSPECT. In analysis and post process the results of the simulation, spatial resolution, noise, contrast and scatter to primary ratio (SPR) was investigated and an optimal design for the scanner detector was presented. The computerized phantom (MOBY) was implemented in simulated scanner and reconstructed images provided by using MATLAB program.

Results Tomographic image of the simulated phantom containing nine cylinders with radial 0.5, 1, 2.5 and 5 mm which were considered filled with tissue equivalent material like skull, lung,ribbon and cartilage were represented the designed system is capable to distinguish soft tissue materials and demonstrate 0.5 mm resolution of the skull (Fig 1-B). The achieved spatial resolution for different materials and dimensions varied in the range of 100 to150 µm with 0.03% of the noise and 0.0015 of SPR.

Conclusion: In this study, a Micro-CT scanner was simulated with GATE Monte Carlo code by considering geometrical limitation of HiReSPECT. Finally all of mentioned parameters were optimized and were obtained good images of it.

SP034.2 - An imaging method by using electron mode of linear accelerator for soft tissue emphasis

Author(s): Atsushi Myojoyama, Hidetoshi Saitoh

Radiological Sciences, Tokyo Metropolitan University, Tokyo/JAPAN

Purpose

Megavoltage portal images are used to verify the proper positioning of the patient in image-guided radiation therapy (IGRT). However, the description of low density material reconstructed by MV image doesn't reach kilovoltage one because the flattening filter of linear accelerator causes beam hardening and an increase of scattered photon. To solve this problem, we designed a new image acquisition method by using electron mode of linear accelerator. The low contrast image is acquired by this method because the focus of the target becomes large by attaching to the shadow tray of a linear accelerator, and because Mega-voltage X-rays cause Compton scattering much within human body. To approach those problems, in this study, we propose a 2-pass 3D image reconstruction using simple Monte Carlo method. Feld Kamp, Davis and Kress (FDK) method was used for 3D reconstruction, and BEAMnrc based simple Monte Carlo method was developed to estimate scattering photons.

Method

The portal images were taken by using bremsstrahlung x-ray that was generated by the target newly attached under secondary collimators.To estimate scattering photon, 3D reconstruction was performed in two steps. By the first step, the rough structure was reconstructed by FDK method. In this step, graphic processing unit (GPU) was utilized to reduce the processing time. In this study, a NVIDIA Geforce GTX970 (CUDA) was used for parallel processing. By the next step, the simulation for investigating the relation between the generating position of a scattering photon and EPID data was performed by using the first reconstructed data. Although the most reliable method was Monte Carlo simulation, that was time consuming process and was not practical. Therefore, simple Monte Carlo (SMC) using GPU acceleration was proposed. Although some SMC was proposed, we chose the method of holding and reusing in a memory the result of the full Monte Carlo that was calculated beforehand. In this method, BEAMnrc code system was used for estimating position of scattering photon in an object. Since it was necessary to perform our method for every rotation angle of a gantry, the proposed method needed high-speed processing. This method was accelerated by holding beforehand the full Monte Carlo calculation result to the HU range of primary reconstruction data. Aluminum target were selected for proposed method. This method was simulated and measured on 4, 6 and 9 MeV electron beam.

Result and Conclusion

The calculation time of proposed SMC was about 9 seconds per one projection. The processing time consumed to 180 projections was 27 minutes. The result images emphasized soft tissue than the images acquired by high energy X-ray.

SP034.3 - Anatomical noise model for CT head images: preliminary results

Author(s): Rafael A. Miller-Clemente¹, <u>Marlen Perez-Diaz²</u> ¹Group Of Radiation Medical Physics, Biofísica Médica, Santiago de Cuba/CUBA, ²Study Center On Electronic And Information Technologies, Universidad Central "Marta Abreu"de las Villas, Santa clara/ CUBA

The availability of an anatomical predictive noise model provides new knowledge about the physical factors tradeoff and the quantitative effect of multiple factors over the diagnostic image quality. Here, the anatomical noise was defined as the standard deviation of pixel intensities, contained in a region located at the center of an axial CT pediatric head image. Images were obtained by using an Automatic Exposure Control system. The purpose of this work was to determine the association between the noise on diagnostic images and a noise model based on phantom measurements. The model of anatomical noise obtained has an adequate predictive value, with a correlation coefficient of 0.97 (significance level of 95%) and mean square error of 1.9×10^{-6} .

SP034.4 - The potential of spectral-CT for material decomposition with gold-nanoparticle and iodine contrast Author(s): Byungdu Jo

Department Of Radiological Science, College Of Health Science, Yonsei university, Wonju/KOREA

The objective of the this study was to demonstrate feasibility of using gold contrast-agent as a new contrast agent for spectralcomputed tomography (CT) system and decompose the iodine and gold materials in the spectral-CT system using K-edge imaging technique. Recently, gold based nanoparticles contrast-agent has been introduced for vulnerable plaque imaging in CT system. The spectral-CT system equipped with Cadmium Zinc Telluride (CZT)-based photon-counting detector has energy-discrimination capabilities and high resolution image acquisition capabilities. We performed a simulation study using the Geant4 Application for Tomographic Emission (GATE) simulation. The CZT detector contained four CZT crystals and total detector length is 51.2 mm with 64 channel array. The results showed that the contrast-to-noise ratios of iodine and gold contrast-agent materials in energy window included K-edge energy of materials (33-49 keV for iodine, 66-81 keV for gold) were increased approximately 1.9 and 1.7 times higher than others. These results also show the possibility of potential of using two contrast-agents at a time to provide the various information of image such as plaque vulnerability assessment.

SP034.5 - Spatial Resolution Studies for a Prototype Proton CT Scanner

Author(s): <u>Tia E. Plautz</u>¹, Robert P. Johnson¹, Hartmut F.-. Sadrozinski¹, Andriy Zatserklyaniy¹, Vladimir Bashkirov², Reinhard W. Schulte², Robert F. Hurley², Valentina Giacometti³ ¹Scipp, University of California, Santa Cruz, Santa Cruz/CA/UNITED STATES OF AMERICA, ²Radiation Research Laboratories, Loma Linda University, Loma Linda/UNITED STATES OF AMERICA, ³Centre For Medical Radiation Physics, University of Wollongong, Wollongong/NSW/AUSTRALIA

We report on the simulation and initial beam test results with the pre-clinical (phase II) head scanner developed for proton computed tomography (pCT) by the pCT collaboration. In the future, proton CT may be employed to improve the accuracy of relative stopping power definition in patients treated with proton therapy. The phase II proton CT system consists of two silicon telescopes that track individual protons before and after a phantom, and a novel 5-stage scintillation detector that measures a combination of the residual energy and range of the proton. Residual energy is converted to water equivalent path length (WEPL) of the protons in the scanned object. The set of WEPL values and associated paths of protons passing through the object over a 360° angular scan is processed by an iterative parallelizable reconstruction algorithm that runs on GP-GPU hardware. This report will focus on studies of the spatial resolution of the phase II imaging system, while studies of the achievable accuracy of relative stopping power will be reported elsewhere. A custom edge phantom composed of water-equivalent polymer with 4 body-equivalent material inserts was developed. The phantom was first simulated using Geant4 and then built for experimental

beam tests with 200 MeV protons at the research beam line at the Loma Linda University Medical Center. A modified version of the oversampling method was used in order to construct edge spread functions and modulation transfer functions for materials of varying relative stopping powers located at several radial displacements from the center of the phantom. A combination of angular cuts with the aim to eliminate large-angle scattered protons, the most likely path (MLP) concept, and a superiorization method in iterative image reconstruction are used to improve the spatial resolution of the image reconstruction. These sophisticated and computing-intensive techniques are being compared to simpler and much faster reconstruction methods including filtered back projection along curved paths and cubic-spline path approximation. Reconstructions of pCT data sets obtained with a realistic anatomical head phantom will further complement the analysis of the MTF.

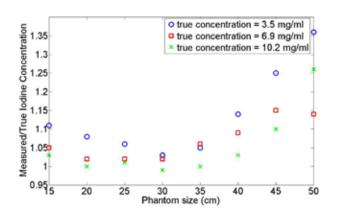

SP034.6 - Influences of object size and tube potential pairing on the accuracy of iodine quantification using dual energy CT Author(s): Josh Grimes, Lifeng Yu, Shuai Leng, Cynthia Mccollough Mayo Clinic, Rochester/MN/UNITED STATES OF AMERICA

Purpose: The objective of this study was to evaluate the accuracy of iodine quantification in phantom images acquired on a dual-source dual-energy CT scanner. The influences of phantom size and different tube potential pairs were investigated.

Methods: Three bottles with iodine concentrations of 3.5, 7 and 10.5 mg/mL were placed inside 8 torso-shaped water phantoms ranging from 15 to 50 cm in lateral width. Dual energy scans of each phantom were acquired on a dual-source CT system (Siemens Somatom Force) using 4 different tube potential pairs (low energy: 70, 80, 90, and 100 kV; high energy: 150 kV + 0.6 mm Sn). CTDIvol was matched for all scans of a given phantom size. Images were reconstructed with 1-mm image thickness at 0.8 mm intervals using a medium smooth body kernel. The dual-energy data were post-processed using commercial software (syngo Via Dual Energy, VA30), which generated virtual non-contrast and iodine overlay images. lodine concentration (in mg/ml) was displayed for regions of interest drawn over the iodine bottles, and compared with the known concentrations for each phantom size and tube potential pairing.

Results: At 70/150Sn, the measured iodine concentration was within 9% of the known concentration for phantom sizes from 15-45 cm. However, images acquired at 70/150Sn were deemed unacceptable for phantom sizes greater than 35 cm due to ring artifacts. At 80/150Sn, 90/150Sn and 100/150Sn, iodine concentrations determined for phantom sizes up to 45 cm agreed with known concentrations within 14%, 25% and 19%, respectively. At 100/150Sn, the iodine concentration in the 50 cm phantom was within 27% of the known value. Iodine quantification was most accurate (within 2% for all tube potential pairs) for the highest iodine concentration (10.5 mg/ml) in the 30 cm phantom. As phantom sizes increased or decreased from 30 cm, iodine concentration was increasingly overestimated.

Conclusion: The accuracy of iodine quantification depends strongly on the phantom size. When selecting the tube potential pairing, both image quality (e.g. artifacts) and accuracy of measured iodine concentration should be considered.

SP034.7 - Characterization of Vulnerable Plaque with Dual-Energy during CT Coronary Angiography: A Phantom Study Author(s): <u>Ali Ursani</u>¹, Sachin Moghe², Carlton Hoy³, Narinder Paul⁴ ¹Medical Engineering, University Health Network, Toronto/ON/ CANADA, ²Toshiba Medical Research Institute, Toshiba Medical USA, Vernon Hills/IL/UNITED STATES OF AMERICA, ³Mechanical & Industrial Engineering, University of Toronto, Toronto/ON/CANA-DA, ⁴Medical Imaging, University Health Network, Toronto/CANADA

PURPOSE/AIM:

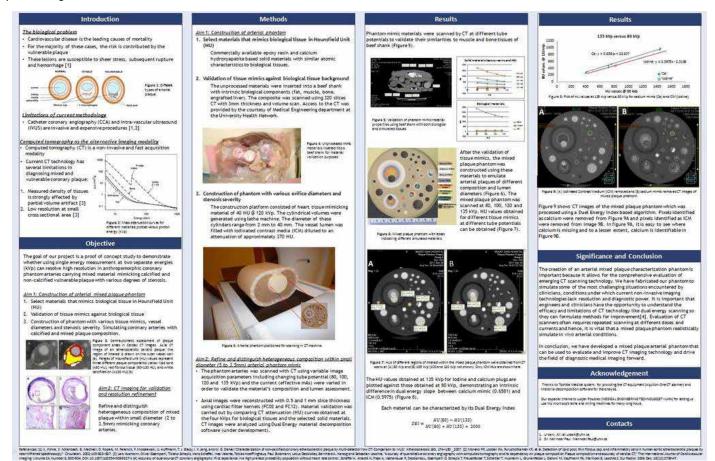

The aim of this exhibit is to: Demonstrate the utility of Dual Energy image acquisition and post processing to provide high-resolution characterization of mixed arterial plaque in an anthropomorphic coronary artery phantom composed of tissue equivalent materials. Introduce the concept of a Dual Energy index and material decomposition algorithm.

CONTENT ORGANIZATION:

Description of the Dual Energy Coronary Artery Phantom containing arteries with variable degrees of lumen stenosis Specifications for the mass attenuation properties of materials mimicking the spectrum of calcified and non-calcified vulnerable plaque Validation of attenuation properties of phantom based materials compared to biological tissues compared at different energies. Calculation of Dual Energy Index and energy - attenuation plot for iodine and calcium based materials present in the phantom. Use of Dual energy material decomposition software to generate iodine and calcium removed images to improve accuracy of stenosis assessment.

RESULTS SUMMARY:

A tissue equivalent coronary artery phantom is extremely useful in demonstrating significant improvements in accuracy of stenosis measurement and characterization of vulnerable coronary artery plaque with Dual Energy image acquisition and post processing.

SP034.8 - The combination of a custom vascular perfusion contrast agent and dual-energy micro-CT to characterize bone-related vasculature

Author(s): <u>Justin Tse</u>¹, Vasek Pitelka¹, Joy Dunmore-Buyze², Maria Drangova³, David Holdsworth³

¹Imaging Research Laboratories, University of Western Ontario, Robarts Research Institute, London/CANADA, ²Schulich School Of Medicine And Dentistry, University of Western Ontario, London/ CANADA, ³Medical Biophysics, Western University, London/ON/ CANADA

Osteoarthritis (OA) is a debilitating chronic joint disease that is becoming a growing concern among the aging population. Due to its complex nature, many questions regarding its initiation and progression remain unanswered. There has been a renewed interest in the bone-associated vasculature, and the role they may play in OA. Thus, having the ability to quantify and characterize the vascular changes (patency, density, and micro-architecture) provide more information into OA's initiation and progression.

Micro-computed tomography (micro-CT) is widely used for its ability to provide well-characterized bone. However, the visualization of associated vasculature is difficulty due to their (1) size (5-10 μ m for capillaries), (2) poor inherent x-ray contrast, and (3) proximity to highly x-ray attenuating bone. We propose the combination of a custom exogenous vascular perfusion contrast agent, dual-energy micro-CT (DECT), and decomposition algorithms to allow for the distinct and separate visualization of the perfused vasculature and bone.

To demonstrate the capabilities of our combination technique, a lanthanide-based vascular perfusion contrast agent and x-ray filter was developed. We perfused the lower half of a rat with our vascular contrast agent through the aorta and embedded the excised left hindlimb in agar. The sample was then scanned on our GE Vision120 speCZT (GE Healthcare, London, ON) at two energies, with appropriate filtration to tailor the output x-ray spectra, that straddled the absorption edge of our vascular contrast agent.

Figure 1 displays the results of our combination technique. Minimal differences can be observed between the low energy and high energy (Fig. 1) scans. However, once decomposition algorithms are applied, the images can be decomposed into separate and distinct images of bone and perfused vasculature (Fig. 1). 3D Renderings of the bone and its associated vascular supply (Fig. 1 A and B) are presented further demonstrate the large internal vascular supply of bone. Bone and cartilage degeneration observed in OA may be partially attributed interruptions or changes in their vascular supply.

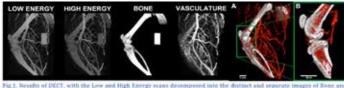

Fig.1, results of DCC1, with the Low and stign theory scans decomposed into the distinct and reparate images of their an jerthicsel Socialitative, (A/B) 3D renderings displaying the interplay between performed vacuatative (red) and isone (white jerale har = 5 mm

Thus, by applying our combination technique to a well-characterized surgically induced rat hindlimb OA model, we may able to provide further insight into the role of the joint's vascular supply as OA initiates and progresses.

SP035 - Imaging Detector Technology

TRACK 01: IMAGING

SP035.1 - Detectability in SPECT Myocardial Perfusion Imaging: Comparison between a Conventional and a Semiconductor Detector System

Author(s): Caroline M. Dartora, Mariana S. Favero, <u>Ana M. Marques</u> <u>Da Silva</u>

Faculdade De Física, PUCRS, Porto Alegre/BRAZIL

The aim of this study is to compare cold lesions detectability in myocardium SPECT images acquired by two cameras: a conventional SPECT with scintillation detector (Philips Cardio MD) and a cadmium-zinc-telluride (CZT) semiconductor detector system (GE Discovery NM 530C). The test object is an anthropomorphic torso phantom with cardiac insert, filled with 99mTc, simulating a SPECT myocardial perfusion acquisition. Images were reconstructed using the standard clinical department protocol, and were analyzed by axial and lateral count profiles and polar distributions. The lateral profile showed that contrast between the lesion region and background in Cardio MD camera is higher (62.2%) than in the CZT camera (42.5%). The axial profile showed a higher contrast (37.0%) in the CZT camera compared to Cardio MD (31.9%). CZT showed a higher contrast between background and maximum activity point along the line (68.2%) than in the Cardio MD (57.5%). Performing the maximum region relative count and the lesion area analysis, it was verified that contrast between these regions are 31.2% and 25.5% to CZT and Cardio MD, respectively. The results showed the cold myocardium lesion detectability is enhanced in the CZT camera. The polar map in the CZT camera displays a better uniformity between the segments' counting, which means the lesion identification is clearer than in the Cardio MD camera, where the distribution is diffuse and the lesion is unclear. In conclusion, the physical performance of CZT camera is higher than conventional camera, but further studies are required to evaluate other parameters, such as spatial resolution, sensitivity and contrast-to-noise ratio.

SP035.2 - The performance of the CMOS APS detector for dual energy contrast enhanced digital mammography Author(s): <u>llias Billas</u>¹, Anastasios C. Konstantinidis², Robert D. Speller³

¹Radiation Dosimetry, National Physical Laboratory, London/ UNITED KINGDOM, ²Christie Medical Physics And Engineering, The Christe NHS Foundation Trust, Manchester/UNITED KING-DOM, ³Medical Physics And Bioengineering, University College London, London/UNITED KINGDOM

Dual energy (DE) technique has been used for many years in digital radiography, as it allows significant advantages in image contrast. In mammography, clinical applications have shown that the use of DE contrast enhanced digital mammography (CEDM) can explore angiogenesis in breast carcinoma by tracking the uptake and washout of an injected contrast medium, usually iodine, in breast tissue. New digital x-ray detectors, such as complementary metal-oxidesemiconductor (CMOS) active pixel sensor (APS), have the prospective to be combined with this technique for the early detection of breast cancer. They offer an alternative to charge-coupled devices (CCDs) and flat panel detectors (FPDs) due to radiation tolerance, low-cost mass production, low power consumption, very fast image acquisition and low electronic noise. The purpose of this study is to implement the DE CEDM using a CMOS APS based x-ray detector to effectively measure the iodine projected thickness while keeping radiation dose in low levels.

The x-ray performance of the CMOS APS detector is evaluated based on experimentally measured pre-sampling modulation transfer function (pMTF), normalized noise power spectrum (NNPS) and signal-to-noise ratio (SNR). Image simulation is performed modelling the detector characteristics and the x-ray source (Xcomp5r) to estimate optimal dual energy conditions. Breast phantoms are carefully prepared to simulate the properties of real breast tissue and images are acquired using a tungsten anode x-ray source. Inside the phantom, a 2 mm diameter tube, representing the minimum tumor sizes developing angiogenesis, is placed for the injection of the different contrast media concentrations. The mean glandular dose (MGD) is evaluated and kept as low as possible to achieve sufficient image quality. The influence of scatter radiation on DE images is investigated and artefacts are reduced using a scatter-correction algorithm.

The optimum image combination is found to be at 48 kVp for both low- and high-energy x-ray beams with 0.2 mm tin and 0.3 mm copper filtration, respectively. This combination reduces the irradiation time and consequently minimizes patient motion artefacts and radiation dose. For seven image pairs, the total MGD is 1.4 mGy, which does not exceed the equivalent from a typical mammogram. Good agreement is found between the experimental and simulated results (i.e. 0.5% difference), showing that the image simulation tool is accurate to optimize a larger number of parameters and their combinations for good image quality. It is shown that the scattercorrection algorithm yields an improvement of 24% in determining iodine projected thickness, yielding an overall accuracy of the DE CEDM and CMOS APS combination within about 3% compared to the actual iodine projected thickness.

Results show that the iodine projected thickness can be effectively measured from iodinated images, and other applications, such as the measurement of contrast medium kinetics, are expectable. The performance of CMOS APS x-ray detector is within clinically acceptable accuracy and comparable with state-of-the-art technology reported in literature. This indicates that the proposed technology can be successfully combined with the DE CEDM technique for detection of early breast cancer.

SP035.3 - Apodized-Aperture Pixel Design of an X-Ray Detector with Enhanced High-Frequency DQE and Reduced Noise Aliasing

Author(s): Elina Ismailova1, Ian A. Cunningham2

¹Medical Biophysics, University of Western Ontario, London/CAN-ADA, ²Medical Biophysics, University of Western Ontario, London/ ON/CANADA

The detective quantum efficiency (DQE) is a characteristic of an imaging system representing its imaging performance relative to an ideal imaging system. While high DQE values are necessary to maximize image quality using low x-ray exposures, typical DQE values are ~0.7 at low spatial frequencies and ~0.3 or less at high frequencies. We describe a CMOS/selenium-based detector using an apodized-aperture pixel (AAP) design that could achieve a new-uniform DQE over all spatial frequencies for mammographic applications. The method uses very small physical sensor elements on the CMOS sensor to synthesis larger image pixels using a novel filter design. A numerical method of optimizing the filter shape to minimize noise aliasing and maximize the DQE is described. A cascaded-systems analysis shows the limiting high-frequency DQE value can be increased from 0.3 to 0.7. The AAP approach is validated on a CMOS/CsI-based laboratory detector where the limiting DQE is increased from 0.2 to 0.4.

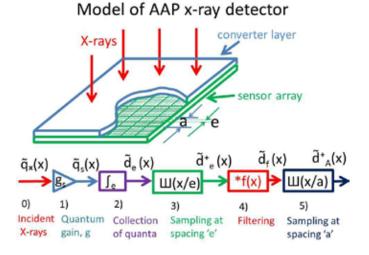

Figure 1 Developed AAP design of an x-ray detector accompanied by the cascaded system analysis.

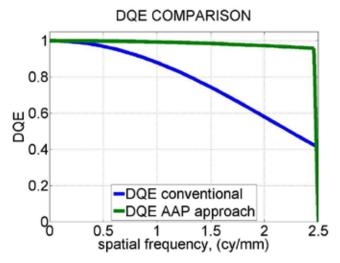

Figure 2 DQE of the conventional versus AAP x-ray detector models.

SP035.4 - Geant4 Simulations of Scintillation Light Collection and Extraction in PET/CT Detectors

Author(s): <u>Francis Loignon-Houle</u>¹, Catherine M. Pepin¹, Serge Charlebois², Roger Lecomte¹

¹Nuclear Medicine And Radiobiology, Université de Sherbrooke, Sherbrooke/QC/CANADA, ²Electrical And Computer Engineering, Université de Sherbrooke, Sherbrooke/QC/CANADA

Introduction

Scintillation detectors are made of scintillation crystals coupled to photodetectors (photodiode, photomultiplier tube, SiPM, etc.). The performance of these detectors (energy and timing resolution, detection threshold, etc.) strongly depends on the collection and extraction of scintillation light from the crystal to the photodetector. To ensure high spatial resolution and high detection efficiency, scintillators must be arranged in compact arrays with unfavorable shapes for photon transport. In typical polished scintillators (n=1.8) with a form factor length/surface > 5, up to 40% of signal is lost to absorption and trapping within the crystal and attenuation through interfaces to the photodetector. In highly pixelated arrays, this loss is compounded with crosstalk effects, squandering valuable signal to adjacent pixels. The purpose of this study is to uncover processes responsible for light losses in scintillator arrays and investigate ways

of enhancing light transport and extraction from pixelated crystals.

Materials and Methods

The Monte Carlo software Geant4 was used to simulate 511keV annihilation photon interactions occurring in parallelepiped Lu1.9Y0.1SiO5 (LYSO) scintillators and to track the propagation of the produced scintillation photons. 4×8 crystal arrays made of 12mm high pixels at a pitch of 1.2 mm were simulated. All crystal surfaces were defined as polished with reflectors (3M-ESR or silver foil) bonded to the lateral faces using an optical adhesive (n=1.5). Each pixel was covered with a diffuse reflector on one end (Lumirror) and read out from the other end by a surface emulating an avalanche photodiode (APD) with quantum efficiency of ~65% @ 420 nm.

Results and Discussion

Simulations revealed four main contributions to crosstalk between scintillators. First, energetic primary electrons generated near pixel lateral surfaces may escape to adjacent crystals, thus losing a fraction of the initial 511-keV energy. Since the maximum mean free path of 511-keV photoelectrons is limited to ~100 μ m, this effect was found to be significant for interactions occurring within ~75 μ m from the surface (up to 30% signal loss). Second, the 3M-ESR reflectivity severely drops from 98% down to 20% below 400 nm. Signal loss due to photons transmitted through the reflector was estimated to ~10%. This was found to be avoided with metallic reflectors. Third, the manufacturing technique used to assemble scintillator arrays is responsible for some optical leakage at the edges of pixels, resulting in asymmetric optical crosstalk amounting to 3%. Finally, scintillation photon propagation within the optical coupling layer was also found to spread the signal to adjacent crystals.

Scintillation photons escaping through the readout window have to cross multiple interfaces (optical coupling, Si3N4 antireflective layer) before reaching the photodetector sensitive area. Simulations reveal a strong dependence of the transmitted light fraction on angular distribution and wavelength of photons reaching each interface. Since most photons impinge on interfaces far from normal incidence, improvements in extracting these photons are feasible by adjusting the thickness and refractive index of the multiple interface layers.

Progress in scintillation light transport and extraction can potentially be achieved by optimizing all factors identified in this simulation study.

SP035.5 - LabPETII.5: APD-based Detector Characterization for Pre-clinical PET Imaging

Author(s): Émilie Gaudin¹, Mélanie Bergeron¹, Catherine M. Pepin¹, Jules Cadorette¹, Réjean Fontaine², Roger Lecomte¹ ¹Nuclear Medicine And Radiobiology, Université Sherbrooke, Sherbrooke/CANADA, ²Department Of Electrical And Computer Engineering, Université de Sherbrooke, Sherbrooke/CANADA

Introduction

The LabPETII.5 is an avalanche photodiode (APD) based pixelated detector module designed to achieve submillimetric spatial resolution in pre-clinical positron emission tomography (PET). This technology was also designed to be used as a generic platform for ultra-high resolution PET imaging of small- and medium-size animals and dedicated clinical applications in humans (brain, breast and articulation).

Methods

The detector module is based on a 4×8 array of

Lu1.9Y0.1SiO5 (LYSO) crystals (1.12×1.12×12 mm³) with one-to-one coupling to a 4×8 APD pixel array mounted on a ceramic holder.

Several performance characteristics were measured as a function of bias voltage for a set of 10 prototype modules: dark current (ID), relative APD gain, noise threshold (converted into keV for 200 cps without source), gain spread (maximum/minimum photopeak position), energy resolution (ΔE) and intrinsic time resolution (ΔT). *ID* and APD gain measurements were performed up to breakdown voltage to determine the APD operating range. Other measurements were performed using a LabPET™ multi-channel digital data acquisition system (180 ns peaking time, preamplifier gain=8.4 mV/fC). To estimate the noise level, gain spread and ΔE , a two-minute measurement was acquired with a 68Ge source (511 keV) in front of the array, followed by a 30-second background measurement without source to substract the ¹⁷⁶Lu natural radioactivity present in the LYSO. ΔT measurements were taken in reference to a timing probe consisting of a ¹⁸F-doped liquid scintillation/PMT detector. Results were obtained for bias values from 225 V to a maximum bias where at least 10 channels saturated the electronics.

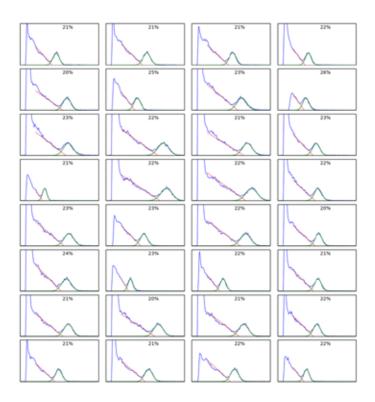

Results

ID, relative APD gain, and ΔT curves were obtained as a function of bias for all pixels. At the optimum operating bias determined from ΔT measurements, the average *ID*, noise, gain spread, ΔE and ΔT results are respectively 18±8 nA, 39±21 keV, 3.2±1, 22±2% and 3.7±0.3 ns (with an energy threshold of 400 keV). Energy spectra with the Compton-corrected energy resolution Gaussian fit are displayed for one typical module in Figure1.

Conclusion

These results confirm the suitable electronic and physical performance of the detector for annihilation radiation detection. Further investigations are in progress to evaluate the imaging performance of the module for PET.

Figure 1. Energy spectra and resolution (ΔE) for a typicalLabPETII.5 module. The ER was measured with a ⁶⁸Ge source (511 keV). The average ΔE is 22 ± 1%. The average noise threshold is 31 ± 7 keV.

SP035.6 - An alternate mathematical modeling of image formation, and framework for performance analysis of positioning algorithms in the scintillation camera Author(s): Soheil Hosseini, Mohammad Hossien Farahani, Moham-

mad Reza Ay Research Center For Molecular And Cellular Imaging, Tehran Uni-

versity of Medical Sciences, Tehran/IRAN

Introduction: Substantive amount of work has been done in modeling the scintillation camera system processes including positioning and image formation. This study presents an alternate mathematical modeling and subsequently framework for performance analysis of different positioning algorithms, followed by experimentation with and comparative study of several of the system parameters.

Methods: Making the assumption that a scintillation occurring in the gamma camera will result in a deterministic number of photons (proportional only to the solid angle at which it sees the detector array), the detector array counts will be found to follow the multinomial distribution with underlying probabilities determined purely through geometrical analysis. The statistical characterizations of mean, variance, and covariance of the counts will therefore be known from statistics. Anger arithmetics being presentable in terms of matrix operations on the counts vector, the mean vector and covariance matrix of the positioning output will therefore be explicitly expressible in terms of statistical characterizations of count values. Maps can moreover be constructed of displacement and blurring intensity corresponding to each point on the detector, characterizing its linearity and resolution performance. This constitutes a framework for performance analysis of different positioning algorithms. In Section I, the model is used to produce comparisons concerning photomultiplier tube (PMT) shape (square-circular-hexagonal), size, non-uniform response, and gain. In Section II, the framework has been used to analyze the performance of two more complex positioning arithmetics, involving nonlinear conditioning and exploitation of row and column sums; to that end, a new matrix formulation of the positioning output is first developed, and statistical characterization of the output are then derived using relations for moments of functions of random vectors. In Section III, the model is extended to include the complete system, including realistic versions of source, collimator and crystal, and maps are constructed for the sample case where the crystal has non-zero thickness.

Results: Figure 1 shows the case where the PMT shape and (equivalent of) size have been studied. Similar figures are created for other parameters.

Discussion: The model is evaluated against Monte Carlo simulation in several scenarios and is found to perfectly match down to any significant digit. This model can be used for in-depth study and analysis of the scintillation camera

SP036 - Treatment Planning - Motion and Robustness

TRACK 04: RADIATION ONCOLOGY

SP036.1 - Robust optimization with independent beams produces robustly matched fields for intensity-modulated proton therapy treatments

Author(s): Albin Fredriksson

Department Of Research, RaySearch Laboratories, Stockholm/ SWEDEN

Background

Intensity-modulated proton therapy of the craniospinal axis typically involves matched posterior spinal fields in order to cover the spinal cord. Setup errors separating or bringing the matched fields together can cause respectively under- and overdosage at the field junction. Wedge-shaped matched beam doses, which slowly increase from zero to the prescribed dose, reduce this risk. Beam dose wedges can be achieved by treatment planning using multiple auxiliary planning structures, but such a manual process is often time-consuming. The aim of this work is to give proof-of-concept of how the creation of beam dose wedges can be automated by the use of robust optimization.

Methods

The robust optimization of the RayStation treatment planning system (RaySearch Laboratories, Stockholm, Sweden) was augmented with the ability to let setup uncertainty affect the beams independently. RayStation's robust optimization uses dose distributions for multiple scenarios and aims to minimize the objective value under the worst case scenario. When the setup uncertainty affects the beams independently, a scenario is constituted of a specific setup error for each individual beam. For example, if two beams are used, then the total dose distribution under a given scenario may be the sum of the beam doses resulting when beam 1 is shifted superiorly and beam 2 is shifting inferiorly relative to their isocenters.

Results

Robust optimization with beams independently affected by setup uncertainty was applied to intensity-modulated proton therapy treatment planning for a craniospinal case using two parallel-opposed lateral cranial fields and two matched posterior spinal fields. The independent beam setup uncertainty was set to ± 5 mm along the superoinferior axis. The optimization problem included the planning target volume and the external region without any auxiliary structures. Figure 1 shows line doses of the optimized plan over the spinal field junction. The optimization has resulted in clear beam dose wedges. The nominal total dose is slightly above the prescription of 20 Gy in order to ensure that the total dose resulting when the beams are separated is at the prescription. This provides proof-ofconcept that robust optimization is a viable tool for creating robustly matched fields.

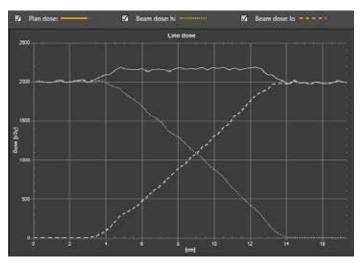

Figure 1: Total dose and beam doses at the junction of the spinal fields resulting from robust optimization with independent beams.

SP036.2 - Rotational tolerance in lung cancer image-guided radiation therapy

Author(s): Peter Hoang¹, Marcin Wierzbicki²

¹McMaster University, Hamilton/ON/CANADA, ²Juravinski Cancer Centre, Hamilton/ON/CANADA

Purpose: Previously, we utilized deformable image registration (DIR) to optimize planning target volume (PTV) margins in lung cancer image-guided radiation therapy (IGRT). In this study, we have developed a method using DIR to assess the tolerance of rotational error for different image matching strategies.

Methods and Materials: 132 cone-beam computed tomography (kV CBCT) images of 8 lung cancer patients were used. Images simulating perfect set-up were created by registering each planning CT image with a CBCT image at each fraction with translations and rotations enabled. These images were rotated in all combinations of the x-,y-,and z-directions (pitch, yaw, roll) by 1,3,5, and 6 degrees around the centre of the spinal cord. Rotated CT images were translated to match the CBCT data nearby the spinal cord/carina or internal target volume (ITV) to obtain a simulated couch correction. Deformable image registration was used to automatically position the planning ITV on each final CBCT. ITV coverage was quantified as the percentage of the ITV surface that fell within generated PTVs.

Results: Each fraction comprised 26 rotation simulations per rotation magnitude, so a total of 3432 simulated images were analyzed per degree rotation. To achieve perfect setup, mean rotations (\pm standard deviation) of 1.3 \pm 1.0, 1.1 \pm 0.9, and 0.6 \pm 0.6 degrees about the left-right (LR), anterior-posterior (AP), and superior-inferior (SI) axes were necessary. For our currently employed 6 LR,6 AP,10 SI mm PTV margin with cord/carina matching the mean ITV surface coverage was 99.1 \pm 3.8, 98.7 \pm 4.3, 96.6 \pm 6.0, and 94.5 \pm 7.9% for 1, 3, 5, and 6 degrees of rotation, respectively. Coverage improvement was seen when matching ITV. Alternatively, Table 1 shows the percentage of fractions where at least 99% of the ITV was within the PTV for different PTV margins and image matching strategies.

	Simulated Rotation (degree)									
PTV	0*	1	3	5	6	0*	1	3	5	6
Margin										
(LR, AP, SI mm)	Cord/Carina Matching ITV Matching									
5,5,5	87.1	86.7	64.1	24.6	13.8	89.4	88.7	79.7	48.9	34.3
5,5,8	89.4	89.0	76.1	39.7	23.6	91.7	91.2	86.4	61.1	46.1
6,6,6	89.4	88.8	80.3	42.6	25.9	91.7	91.9	87.9	64.8	49.2
6,6,10	92.4	92.2	87.1	58.3	42.1	94.7	94.8	92.8	77.5	63.4
7,7,7	91.7	91.4	87.6	58.2	41.1	93.1	94.3	92.3	76.9	61.8
8,8,8	93.9	93.4	91.5	70.8	54.5	97.7	96.7	95.3	86.7	74.4
10,10,10	95.5	95.5	95.5	89.0	77.7	99.2	99.5	99.1	96.3	90.4

*Based on 132 fractions; represents perfect set-up.

Conclusions: We used deformable image registration to evaluate the effect of rotational error in lung IGRT. Our results show that rotational errors of 3 to 5 degrees have significant effect on target coverage in IGRT protocols where couch corrections are employed to match spinal cord/carina or ITV. These results represent a worst case scenario where the patient is misregistered by the given rotation about at least one axis for all fractions. Future analyses will introduce rotations based on their probability of occurring during a treatment course as measured from previously acquired patient data.

SP036.3 - Robustness Assessment of a Novel 4D Optimization Approach for Lung Cancer Radiotherapy

Author(s): <u>Shahad Al-Ward</u>¹, Emily Heath² ¹Medical Biophysics, Ryerson University, Toronto/CANADA, ²Physics, Carleton University, Ottawa/ON/CANADA

Introduction: Respiratory motion is one of the main challenges in treatment of lung tumours with radiation therapy. A novel approach was developed to generate IMRT treatment plans, which compensate for respiratory motion and its variations, by combining intensity maps from plans optimized on the "worst case" motion variation scenarios. The objective of this work was to test this worst case planning method on both simulated and patient respiratory motion variations.

Methodology: A 4D optimization approach was implemented using the KonRad inverse planning system. Two approaches to combining the 4D optimized intensity maps were investigated: the first approach takes the average of the two intensity maps and the second approach takes the maximum intensity of the two intensity maps. The robustness of these worst case plans was compared with ITV based plans and with 4D plans optimized for the nominal motion only on three different respiratory motion variation scenarios. Study 1 investigated the robustness to simulated amplitude variations. Study 2 investigated the robustness to respiratory motion variations measured from a healthy volunteer who was asked to breathe irregularly. Study 3 investigated the robustness to motion variations of a NSCLC patient. Plans were deemed robust if they met a set of pre-defined clinical criteria for all motion variation scenarios in a given study.

Results: The average intensity worst case method was robust to motion variations in Study 3 only, except that the target volume was slightly over-dosed for the nominal motion case (64.92 Gy). The average intensity approach was not robust to motion variations in Study 1 and 2, which we attribute to the larger variation which occurred in those studies compared to the patient case. The maximum intensity worst case method, the ITV plans and the nominal 4D plans

were not robust to any of the motion variations that were tested for all three studies.

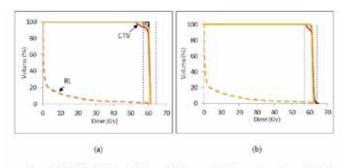

Figure 1: DVHs of (a) Nominal 4D plan and (b) Average Intensity worst case plan applied to the patient motion variation scenarios (Study 3). The DVHs of the CTV and the tumour bearing lung (RL) are shown.

Conclusions: A novel approach to create robust IMRT plans has been tested and found to be robust to most patient respiratory motion variations. Further evaluation over a wide range of tumour sizes, motion amplitudes and variability is required to determine the clinical applicability of the worst case planning method.

SP036.4 - The role of VMAT interplay effects for liver stereotactic body radiation therapy

Author(s): Gillian Ecclestone¹, Greg Pierce²

¹Department Of Radiation Therapy, Tom Baker Cancer Centre, Calgary/CANADA, ²Department Of Medical Physics, Tom Baker Cancer Centre, Calgary/CANADA

Stereotactic body radiation therapy (SBRT) is beneficial in the treatment of solid liver cancers as it safely delivers an ablative tumor dose. Volumetric modulated arc therapy (VMAT) is an ideal modality for hypofractionated treatment regimes such as SBRT as it can efficiently deliver a conformal dose. However, treatment accuracy becomes compromised for liver tumors due to their inherent respiratory motion. Clinicians have raised concerns when treating moving targets with VMAT because the tumor motion relative to the dynamically moving MLCs degrades the plan quality; a phenomenon termed interplay. The purpose of this study is to examine if the amount of beam modulation and breathing cycle length elicits interplay effects that influence plan quality for liver SBRT treated with VMAT.

VMAT treatment plans with varying degrees of modulation were constructed using Eclipse treatment planning software, version 11.0 (Varian Medical Systems, Palo Alto, CA). Respiratory motion was modeled using an in house program that shifted the MLC leaves in each plan to simulate the motion of the GTV from the point of view of the radiation beam. IMRT modulation factors (MFs) ranged from 1.5 - 3.5 and respiratory cycle lengths of 3, 5, 10 and 20 seconds were simulated for all plans.

Minor interplay effects were observed and deemed clinically negligible: the 95% dose coverage of the target was not compromised. A slight degradation in the plan quality (size of 95% isodose) was detected and worsened with longer respiratory cycle lengths and low MFs (Fig. 1). This is attributed to the variation in gantry speed that was coupled to the MF. For high MFs (slower gantry speed), more time was available for the tumor motion to average out during each control point and as a result reducing interplay.

We concluded in this limited phantom study that treatment plan quality of liver SBRT is degraded the least by plans with high modulation factors. Plan fidelity was maintained via few partial arcs (to obtain a slow gantry speed) and adequate PTV margins that accounted for respiration.

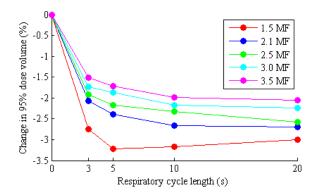

Fig. 1. A plot demonstrating the decrease in plan quality as respiratory cycle length increases and improved plan quality as the MF increases.

SP036.5 - Interplay of MLC, gantry and respiratory motion during DCAT delivery

Author(s): <u>Tanya Kairn</u>¹, Joanne Mitchell¹, Scott Crowe², Jamie Trapp³

¹Physics, Genesis CancerCare Queensland, Auchenflower/AUSTRA-LIA, ²Radiation Oncology, Royal Brisbane and Women's Hospital, Herston/QLD/AUSTRALIA, ³Science And Engineering Faculty, Queensland University of Technology, Brisbane/AUSTRALIA

This study investigated the possible interplay effects arising from the treatment of moving targets using the dynamic conformal arc therapy (DCAT) technique. Interplay effects are known to arise from the treatment of moving anatomy with dynamic wedges and intensity modulated radiotherapy (IMRT) beams. By contrast, volumetric modulated arc therapy (VMAT) treatment beams are currently regarded as largely immune to the effects of motion interplay. This difference potentially arises from the behaviour of multi-leaf collimator (MLC) leaves during IMRT and VMAT delivery, with MLC leaves that moving from one side of each beam to the other during IMRT delivery and MLC leaves frequently change direction throughout VMAT beam delivery. DCAT treatments of lateral targets, including the peripheral lung, often require the treatment isocenter to be displaced medially to avoid collisions between gantry and couch. In these circumstances, the MLC leaf motions in DCAT beams become similar to MLC motions in IMRT beams, moving in one direction from one side of the beam to the other. This situation leads to the concern that DCAT treatments might be more susceptible to motion interplay effects than an assumed similarity to VMAT treatments would suggest.

To investigate this issue, dose from a modulated test beam was measured, with and without phantom motion and with and without a 300 arc rotation, using a diode array placed on a sinusoidally moving platform. Measurements were repeated at five different collimator angles (0, 22.5, 45, 67.5 and 90°), at two different dose rates (300 and 600 MU/min), allowing the relative effects of leaf direction and leaf speed to be evaluated. When in use, the motion platform provided regular, longitudinal (superior-inferior), sinusoidal motion, with a 40 mm peak-to-peak amplitude and a 4 s period.

Results showed that the phantom's respiratory motion produced blurring of the dose penumbrae and consequent reduction of the area receiving high-doses, as well as dose oscillations throughout the high-dose region, which became more obvious as the MLC motion was aligned with the phantom motion direction. The delivery of the modulated beams as 30° arcs increased the penumbral dose blurring, without reducing the appearance of dose oscillations across the phantom. The dose oscillations arising from interplay between phantom and MLC motion were found to increase in magnitude when the dose rate was increased from 300 MU/min to 600 MU/min, effectively halving the time taken to deliver each beam.

These results suggest that DCAT treatment beams may be affected by the interplay of MLC motion and patient respiratory motion, to a similar degree as static gantry IMRT treatment beams, rather than being similar to VMAT beams.

For DCAT beams, like IMRT beams, the negative effects of motion interplay may be minimized by aligning the collimator as close to perpendicular to the dominant direction of respiratory motion as possible, by decreasing the dose rate and thereby increasing the total delivery time of each beam, and by including appropriate margins on treatment targets so that dose blurring at the edges of the beam does not compromise tumour control.

SP036.6 - Impact of deep inspiration breath hold (DIBH) in lymphoma's radiation therapy treatment

Author(s): <u>Daniel Venencia</u>, Jorge Torres, Cristina Pfaff, Carola Sanchez, Jonathan Pacheco, Lucas Caussa, Edgardo Garrigó Fisica Medica, Instituto de Radioterapia - Fundacion Marie Curie, Cordoba/ARGENTINA

Purpose: Lymphoma treatments usually require radiation therapy of mediastinum and supraclavicular lymph nodes. Planning target volume (PTV) involves several organs at risk (OAR) such as lungs, heart and esophagus. The percentage of irradiated lung depends on the PTV and total lung volume. Deep inspiration breath hold (DIBH) increase the lung volume. The objective of this work was to evaluate the impact of DIBH in the treatment of lymphoma with radiation therapy.

Methods and Materials: A virtual treatment simulation was performed acquiring two computed tomography (CT) image series of the patient; the first one during DIBH and the second one with free breathing. Fiducials were placed on the patient's anterior torso surface for CT image acquisition and then used for IGRT localization. CT images were exported to treatment planning system (TPS) iPlan v4.5.3 (BrainLAB). PTV and OAR were segmented in the DIBH CT series. Treatment plans were generated using sIMRT or IMRT treatment technique with a 6MV photon beam produced by a Novalis TX linear accelerator equipped with ExacTrac IGRT system with gaiting capability (BrainLAB). Using iPlan RT Adaptive tool, free breathing/s segmentation and plans were generated. Four patients were analyzed (3 sIMRT and one IMRT). All plans were normalized to have the same D95% at the PTVs. Comparison between lung volumes, dose volume histogram for PTV and OAR and monitor unit (MU) were done between DIBH and free breathing plans.

Results: DIBH lung volume increased in average 1997.7cc [1458.7, 2785.7]. Lung DVH comparison between DIBH and free breathing exhibits a decrease of 6.2% [5, 8.8] in V5, 5.5% [4.6, 7.7] in V10, 4.8% [3.1, 8.4] in V20 and 1.4% [-0.9, 3.7] in V30. The heart showed a mean dose reduction by 2.4Gy [-0.5, 8.7] and V10 by 8.6% [3.3, 33.0]. The esophagus did not show any significant dose variations. DIBH and free breathing plans did not show any differences in MU.

Conclusion: Treatment plans for mediastinal lymphoma planned on DIBH showed a dose reduction in lungs and heart. There is no change in the esophagus dose and MU used. Clinical impact of lung and heart dose reduction must by analyze.

SP036.7 - Cardiac sparing in left-sided breast IMRT using robust optimization

Author(s): <u>Houra Mahmoudzadeh</u>¹, Jenny Lee², Timothy C.Y. Chan¹, Thomas G. Purdie²

¹Mechanical And Industrial Engineering, University of Toronto, Toronto/ON/CANADA, ²Princess Margaret Cancer Centre, Toronto/ CANADA

Purpose: Left-sided breast cancer patients are often at a high risk of post-radiation cardiac toxicity, which is evident many years after the treatment. We test the feasibility of a cardiac sparing IMRT treatment planning model for left-sided breast cancer using a robust optimization framework that can be planned and delivered under free breathing.

Methods: Eight patients with stage 0, I or II left-sided breast cancer were included in this study. A 4D-CT scan was acquired, and an average plan based on the pixel-by-pixel averaged 4D-CT was generated for all patients. Six patients were treated using normal free-breathing conditions and the other two under controlled breath-hold using an active breathing control (ABC) device. The robust optimization method was used to generate treatment plans for all patients. The RO method uses the 4D-CT dataset and a model of uncertainty to mathematically ensure that the clinical dose-volume criteria are met under uncertain breathing conditions. A set of 200 simulated breathing patterns was used to compare the outcome of the average and robust methods under free breathing, and deformable registration was used to find the accumulated dose for each plan.

Results: Robust optimized plans dominated the clinical plans in heart sparing without compromising target coverage. Table 1 shows the amplitude of motion for each patient and compares the range of accumulated heart dose of the average and robust methods for the set of simulated breathing patterns. The robust method reduced the dose to the heart by 364cGy on average. For patient 2, who was classified as an ABC patient, the robust method was able to reduce the dose to an acceptable limit, meaning that the patient would not have required an ABC treatment.

methods using a set of simulated breathing patterns. (*patients 2 and 4 were ABC patients)					
Detient	Motion (cm)	Heart D10cc (cGy)	Mean RO benefit	
Patient		Robust	Average	(cGy)	
1	0.31	[347, 376]	[1146, 1183]	801	
2*	0.21	[2098, 2367]	[2618, 2780]	465	
3	0.36	[235, 735]	[346, 967]	199	
4*	0.36	[3934, 3975]	[4113, 4153]	182	
5	0.23	[614, 783]	[1276, 1564]	522	
6	0.41	[216, 348]	[458, 796]	322	
7	0.42	[1304, 2035]	[1729, 2325]	420	
8	0.72	[0, 0]	[0, 0]	0	

Table 1: Comparing the accumulated D10cc of the robust and average

Conclusions: The robust optimization method can improve cardiac sparing in left-sided breast cancer IMRT, and it can potentially reduce the number of patients who need breath-hold treatments.

SP036.8 - Real Time Tumor Position Control During VMAT Hypofractioned Treatment

Author(s): Rachid Boucenna, <u>Chemseddine Fatnassi</u>, Michael Betz Radio-oncology Department, Hirslanden, Lausanne/SWITZERLAND

Introduction

Hypofractioned treatment requires accurate tumor position control to be effective and safe. We report our initial experience monitoring tumor position during VMAT radiation, using Varian's Motion Intrafraction Review (MIR) system. This system permits real-time target position verification during dose delivery, and incorporates an automatic beam interruption function.

Materials and Methods

We inserted three coils (markers) into the insert of a Lung Dynamic Phantom (LDP[®], CIRS). Two image series were acquired with a Big Bore CT (Philips Healthcare).

The first series was acquired without any target motion, and a planning target volume (PTV) was defined using the static target.

The second series was acquired with a 10-mm dynamic sinusoidal shift. Images were synchronized with the breathing curve (RPM, Varian Medical Systems, VMS) in phase mode, and a PTV was created from an internal target volume incorporating target motion. Average reference planning CT images were generated for positioning and treatment plan calculation.

For both PTVs, single-arc VMAT treatment plans were calculated on the Eclipse Treatment Planning System (VMS). Treatment parameters were: beam energy = 6FFF; dose rate = 1200 MU/min; fractional dose = 8 Gy. Treatment was performed with the TrueBeam accelerator version 2.0 (VMS).

For the static target, the phantom was aligned using marker match registration. Marker position on the acquired images was directly matched to the expected position. The LDP® was used to simulate static target volume shifts in the cranial axis. Performance of the system was assessed using two tumor shifts (2 and 4 mm), respectively within and over a predefined spherical tolerance of 3 mm. During treatment, kV images were acquired at each 10° of gantry rotation, and real-time marker positions were automatically checked by the MIR system.

For the dynamic target, a breathing curve was recorded during CBCT acquisition. The phantom was aligned performing registration with the reference CT. During treatment, images were acquired twice per free breathing cycle, and the MIR system used to verify that markers remained within the PTV. An additional test was performed incorporating a right-left shift exceeding the PTV margin without modifying the breathing curve, to assess the MIR system's ability to detect such an error independently of the information provided by the breathing curve.

Results

For the static targets, the 2-mm shift was recognized as within tolerance, and the treatment completed. The 4-mm shift was recognized as unacceptable, triggering beam interruption.

For the dynamic targets, in the absence of an additional left-right shift the MIR system recognized that marker motion remained within the PTV and treatment was completed. In the presence of an additional left-right shift, the system detected markers outside the PTV and the beam was interrupted even in the presence of a "correct" breathing curve.

Conclusion

Real-time automatic marker position verification during VMAT using the MIR system is capable of detecting shifts in both static and dynamic targets, permitting reduced PTV margins for SBRT treatment with a high per-fraction dose. Automatic treatment interruption in the case of sudden excessive shifts can increase both treatment quality and treatment safety.

SP037 - Dosimetry in Nuclear Medicine

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP037.1 - Comparative Evaluation of Radiation Dose Rates in Cancer Thyroid Patients Treated with Variable Doses of Radioiodine

Author(s): <u>Ajai Kumar Shukla</u>, Dheeraj K. Tewari Nuclear Medicine, SGPGIMS, Lucknow/INDIA

Cancer Thyroid patients after near total thyroidectomy are treated at our centre for radioiodine ablation using variable doses of radioiodine ranging from 3700 MBq to 7700 MBq.Initially the regulatory agency had fixed the discharge limits of 400 MBq at a distance of one meter from the patient and it usually involved a minimum isolation of about three days to decline the activity levels in patients to acceptable limits.However recently this discharge limit has now been increased to 1100 MBq and in order to see the effect of this change on the pattern of radiation levels and also on the time of discharge,the present study was undertaken on a total of 27 patients treated with doses of radioiodine I-131 ranging from 3700 MBq to 7400 MBq.

The radiation levels in uSv/hr at one meter in cancer thyroid patients (n=27) were observed to be below 50 uSv/hr on the second day itself which corressponds to about 1100 MBg residual activity. However in patients with metastatic lesions with avid concentration of I-131,the levels could decline below 50 uSv/hr only after three to four days after administration of I-131. The prolonged period taken in decline of the activity was also attributable to the fact that relatively larger amounts of activities upto 5550 MBg and in few patients 7700 MBg were administered. Prior to change of the discharge limits the decline period used to take in some cases as more than seven days particularly in patients with metastatic lesions and administered with larger activities of the order of 5500 MBg to 7700 MBg.The prolonged isolation causes psychlogical trauma in some patients and therefore it was observed to be a big relief to the patients to have increased discharge limits (which did not cause any significant safety realated issues) apart from treating more number of patients within the avialable infrastructure and number of isolation rooms.In addition it also enabled greater flexibility of dosing the patients with advanced disease conditions thereby reducing the overall cost of treatment.

It could be yet another school of thought to consider fractionation of doses of I-131 in those cases which needed more than seven days of isolation to prevent or minimize the risk of patient landing into extreme level of isolational stress.

SP037.2 - Estimation of the influence of other organs of the body in the determination of the gamma fraction energy emitted by iodine 131 deposited within the thyroid gland

Author(s): <u>Abderrahim Betka</u>¹, Abdelouahab Bentabet², Ahmed Azbouche³, Nourdine Fenineche⁴, Adouda Adjiri¹ ¹setif university, setif/ALGERIA, ²BordjBouariridj université, Algeria, BordjBouariridj/ALGERIA, ³centre de recherche nucleaire alger, Alger/ALGERIA, ⁴IRTES-LERMPS/FR FCLAB, UTBM, Belfort, France, Belfort/FRANCE

When treating hyperthyroidism using lodine 131 and to facilitate and accelerate the computation time in the determination of internal dose within the thyroid gland, the shape, composition and volume of the thyroid tissue in this case is the only important factor to take into account.

This study aims to determine the fraction of energy of the gamma

emission of the radioactive isotope iodine 131 in the thyroid gland and the effect of the individual organs constituting the human body with the exception of the thyroid gland by using the geometry and material composition of each organ

To determine the influence of the entire body, and hence its different constituting organs, on the calculation of the fraction of the gamma energy absorbed by the thyroid gland during the treatment of hyper-thyroidism using iodine-131, we have performed simulations using the Monte Carlo Penelope code in the following two situations:

- Simulation of the entire body by a mathematical anthropomorphic phantom with simple geometric shapes and for this we used the example included in the Penelope code (male.geo file).

- The second situation involves simulating the thyroid gland alone.

Comparison of the results obtained by simulating the thyroid gland alone to those obtained by simulating the whole body shows a difference of 3% on average. The error in determining the dose by simulating only the geometry of the thyroid gland without involving the geometry of other organs of the body is estimated to 3%.

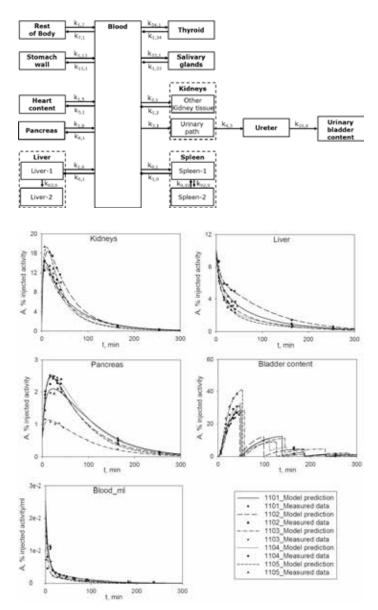

SP037.3 - Personalized compartmental biokinetic modelling and internal dosimetry of two novel radiopharmaceuticals Author(s): <u>Alexandra Zvereva</u>¹, Wei B. Li¹, Nina Petoussi-Henss¹, Helmut Schlattl¹, Uwe Oeh¹, Maria Zankl¹, Stephan Nekolla², Christoph Hoeschen¹, Katia Parodi³, Markus Schwaiger² ¹Research Unit Medical Radiation Physics And Diagnostics, Helmholtz Zentrum München, German Research Center for Environmental Health, Neuherberg/GERMANY, ²Department Of Nuclear Medicine, Klinikum rechts der Isar Technische Universität München, Munich/GERMANY, ³Experimental Physics – Medical Physics, Ludwig Maximilians University (LMU) Munich, Garching/GERMANY

Purpose The objective of this work is to develop personalized compartmental biokinetic models for two novel radiopharmaceuticals BAY85-8050 [1] and BAY94-9392 [2] to predict their distribution in the human body and associated patient-specific organ doses. We also aim to separately consider activities in organ parenchyma and blood in the modelling and dosimetry.

Methods The models are constructed based on clinical PET/CT images, blood and urine samples of 10 healthy volunteers [1,2]. Following an identifiability analysis of the developed models, model parameters were estimated using the commercial program SAAMII. Organ doses were calculated in accordance to the MIRD/ICRP formalism using specific absorbed fractions for photons and electrons previously simulated in the ICRP male and female reference adult computational phantoms.

Results The developed compartmental biokinetic model structure and the subset of the resulting biokinetic model predictions for BAY94-9392 are presented in Figs.1 and 2, respectively. The corresponding figures for BAY85-8050 are not displayed here. The results showed a considerable inter-individual variability between the volunteers with effective dose coefficients of 0.016–0.018 mSv/ MBq (BAY85-8050) and 0.011–0.018 mSv/MBq (BAY94-9392). We compared the personalized organ doses for two cases: (a) activities in organ parenchyma and in blood are separately modelled; (b) aggregate activities in perfused organs. For most organs the doses in case (a) were higher. Consequently, the average effective dose coefficients increased by 8.3% and 8.9% in case (a) for BAY85-8050 and BAY94-9392, respectively. Additionally, a strong influence of bladder-voiding intervals on the bladder-wall doses was demonstrated.

Conclusion The developed models can be used to estimate distributions and dose levels of two novel radiopharmaceuticals. The considerable inter-individual variability helps to understand the intrinsic uncertainties when reference models are applied to individuals and justifies the advantage of personalized modelling approaches.

SP037.4 - TLD Measurement of Absorbed Dose of Workers in PET/CT Department

Author(s): Pardis Ghafarian¹, Sajedeh Zargan², Ali Shabestani Monfared², Ali Akbar Sharafi³, Mehrdad Bakhshayeshkaram¹, Mohammad Reza Ay⁴

¹Chronic Respiratory Diseases Research Center, National Research Institute Of Tuberculosis And Lung Diseases (nritld), Shahid Beheshti University of Medical Sciences, tehran/IRAN, ²Department Of Medical Physics, Babol University of Medical Sciences, Babol/ IRAN, ³Department Of Medical Physics, Iran University of Medical Sciences, Teharn/IRAN, ⁴Department Of Medical Physics And Biomedical Engineering, Tehran University of Medical Sciences, Tehran/IRAN

Introduction: Staff radiation protection is the critical concern in

clinical PET/CT centers due to high gamma energy of F18 using in 18F-FDG PET studies. The aim of this study was to evaluation the staff radiation dose in PET/CT department in Masih Daneshvari hospital.

Material and **Method:** during complete PET/CT imaging steps (from syringe filling to patient departure) the staff radiation dose was investigated with thermoluminescent dosimeter (TLD). The Hp(3) used for doses to the lens of the eyes and Hp(10) for doses to the whole body and Hp(0.07) for doses to the other part .For increasing the measurement accuracy, three chips of TLD used in each point of measurement.

Result: the staff radiation dose were measured for work load of 53 adult patients who receive 374.28±100.30 MBq (range 127-540 MBq) 18F-FDG activity.The mean±SD total effective doses per unit of activity received by dispensing staff (n=3), imaging staff (n=5) and injection staff (n=2) were 4×10-4±5.77×10-5, 8×10-4±1×10-4 and 1×10-3±1×10-1 μ Sv/MBq and received dose in eyes were 1.39×10-6±5.77×10-6, 0.87×10-6±1×10-4 and 3×10-4±1×10-1 μ Sv/MBq as measured with TLD respectively . In this study, the finger radiation dose were higher for injection staff (7×10-6±1×10-1 μ Sv/MBq) versus other radiation workers.

Conclusion: staff sensitive organs such as lens of eyes; thyroid and breast were received low dose in our PET/CT and cyclotron Centre. It is observed that the received radiation dose to radiation workers were below the dose limits recommended by the ICRP for all staff working in PET/CT department. This study confirmed that staff's radiation doses in our PET/CT center were lower than those recommended by the ICRP guideline which can explain using semiautomatic injector, patient video monitoring and strong shielding performed in our center.

SP037.5 - Renewing the radiopharmaceutical accuracy check service for Canadian dose calibrators

Author(s): Raphael Galea, Khalid Gameil, <u>Malcolm R. Mcewen</u> Measurement Science And Standards, National Research Council, Ottawa/ON/CANADA

For a ten year period from 1986-1996, a small fraction of the Canadian nuclear medicine community participated in a service offered by the National Research Council (NRC) to check the accuracy of administered doses of radiopharmaceuticals. Similar programs exist in many countries and are of particular importance given the advent of new sources of medical isotope production anticipated to begin with the shutdown of the NRU medical isotope production in 2016. This service depends on the Secondary Standard Ionization Chambers Systems (SSIRCS) at NRC which is composed of a TPA and an NPL ion chamber coupled with an electrometer. These chambers were calibrated using radionuclidic artifacts standardized by primary methods.

These chambers have been in operation for several decades but were not operated for several years from 2001-2008 when the radionuclide metrology program ceased operations at NRC. A new data acquisition program (DAQ) was developed and new methods of determining the response of the ion chamber and electrometer were included to add redundancy and added assurance as to the calibration. Comparisons between the original and new DAQs were performed to provide validation to the chambers' operation as well as continuity with measurements of radionuclidic artifacts still in the NRC inventory.

The original service involved the participant to measure the desired isotope in a syringe and 5 ml serum vial geometries in their dose calibrator and then send the sample to NRC to be measured in the SSIRCS and to permit an impurity check to be performed. In order to attract participation and simplify the process, the NRC is also offering an alternative service in which an ion chamber is sent to the facility, thus not requiring the shipment of isotopes, at the expense

of an impurity check. The NRC conducted a mock service on two commercial dose calibrator models CRC-35R and CRC-ULTRA for Tc99m resulting in serum vial calibration coefficients that were consistent with unity to 1% (1.005 \pm 0.006 (k=2)). The reference value delivered with the Tc99m dose from the nuclear pharmacy was determined to be 0.977 \pm 0.006 (k=2) of the calibrated activity. While this is well within the recommended guideline of 10% of the required dosage, in most countries, it is significantly different from unity at the 95% confidence interval to warrant the application of a calibration factor, or to monitor this value on a regular basis to detect potential drift due to mechanical of physical changes to the ion chamber.

This work was important to assure the Canadian nuclear medicine community of the existence, validation and improvements of the SSIRCS at NRC and to provide confidence and encouragement in the participation of this proficiency testing service.

SP037.6 - Radiation Dose Assessment of 99mTc-labeled Tetrofosmin in Patients Undergoing Rest-Stress Myocardial Perfusion Scintigraphy

Author(s): Stella Veloza¹, Estrella Avila Ramirez²

¹Physics, Universidad Nacional de Colombia, Bogota, D.C./COLOM-BIA, ²Department Of Nuclear Medicine, DALINDE Medical Centre, Ciudad de Mexico/MEXICO

Purpose: Tetrofosmin labeled with technetium-99m (99mTc) is a myocardial imaging agent. The goal of this research is to evaluate the differences between two methods for assessing radiation dose: internal dosimetry by using a dose calculation program and an analytical model based on patient's weight.

Materials and **Methods:** A biodistribution of 99mTc-Tetrofosmin as reported in the literature was used in OLINDA/EXM-1.0® to estimate patient-specific absorbed and effective radiation doses on 91 adults (33 female, 58 male) who were undergoing 99mTc-Tetrofosmin 8 mCi-rest/ 17 mCi-stress myocardial perfusion imaging. The dosimetry results were compared to the values calculated from scaling by a power function of body weight the values of effective radiation doses for adults from 99mTc-Tetrofosmin rest/stress provided by the International Commission on Radiological Protection (ICRP) publication 106.

Results: The mean effective doses estimated by dosimetry in female patients were 3.46 mSv and 5.91 mSv at rest/stress respectively. In male patients the mean effective dose estimated by dosimetry was 2.87 mGy at rest and 4.86 mGy at stress. For male and female patients of the same weight the dosimetry shows that the women's effective doses are about 17% higher than for men. The effective doses estimated in patients with a weight of 100 kg by the analytical method differed from those based on dosimetry by up to 40% in women and 30% in men at rest and 35% in women and 25% in men at rest.

Conclusions: Even though the standard ICRP dose values are scaled by patients' weight, the effective dose for overweight patients are underestimated, more for female patients than for male patients because ICRP values correspond to an adult male. These underestimations are an important factor to consider if an approach based on differences in patient's weight is used to adjust the amount of activity to be administered.

SP037.8 - Biological Excretion and Half - Life of Remnant Radioactive Iodine 131I in Post Treated Hyperthyroidism Patients. Author(s): <u>Shuaa J. Al-Sadoon</u>¹, Mohammed A. Al-Eid², Taki A. Al-Musawi³, Farid Y. Risheq⁴

¹Physics In Nuclear Medicine, FARID RISHEQ NUCLEAR MEDICINE PET/CT & BONE DENSITY CENTER, AMMAN/JORDAN, ²Nuclear Medicine, AL-MUSTANSIRIYAH UNIVERSITY, COLLEGE OF MEDICINE, BAGHDAD/IRAQ, ³Medical Physics, ALMUSTANSIRIYA UNIVERSITY, BAGHDAD/IRAQ, ⁴Nuclear Medicine, FARID RISHEQ NUCLEAR MEDICINE PET/CT & BONE DENSITY CENTER, AM-MAN/JORDAN

Objective: Following ¹³¹I treatment of hyperthyroidism; remnant activity is depleted by physical decay and bio-excretion. ICRP estimated ¹³¹I biological half-life as (138d-1960), (120d-1979), (80d-1989). This work assesses semi-empirical bio-excretion models and estimates biological half-life of post treated hyperthyroidism patients.

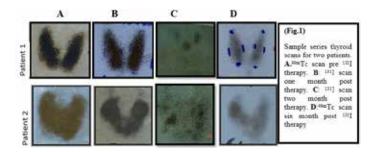

Patients and Method: 17 hyperthyroidism adult patients were treated with ¹³¹I (185-740MBq) depending on hyperthyroidism condition. Thyroid scans were possible by pinhole gamma camera; one and two months post ¹³¹Itherapy utilizing remnant activity.

Semi-empirical excretion models developed were:

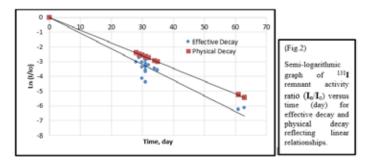

- 1- fixed amount $\Gamma fa(c/s)=lo[e^{-n\lambda p}-(ln/lo)]*[(1-e^{-\lambda p})/(1-e^{-n\lambda p})]$
- 2. fixed fraction $\Gamma ff = e^{-\lambda p} (\ln/lo)^{1/n}$
- **3. exponential** $\Gamma e = e \lambda be$

Bio-excretion/effective decay = (Inp-In) / (Io-In), TE=-0.693n(day)/ In(In/Io), Tb=TpTE /(Tp-TE), Io and In are: initial and nth day activity (c/s), decay coefficient λ =0.693/T, T=half life(d); subscripts: p, b, E are respectively physical, biological and effective.

Results and Discussion: Sample series of thyroid scans are shown in (Fig.1):(A)^{99m}Tc scan pre-treatment;(B)¹³¹I scan one month post-treatment,(C)¹³¹I scan two month post-treatment;(D)^{99m}Tc scan six months post-treatment.

A semi logarithmic graph of relative (In/Io) versus time (d) showed linear relationship of ¹³¹I remnant activity effective decay and physical decay,(Fig.2), slope=0.693/TE=0.103,(R²=0.895), and slope=1,(R²=1) respectively. Accordingly, TE=6.73d, Tb=41.0d. Calculated Tb average value= $40.7\pm21.4d$.

Measured bio-excretion of ¹³¹I contributes 3.5% of effective decay as compared to 96.5% for physical decay. Fixed amount model predicts ~9.3% bio-excretion contribution; not significant with measured values. Fixed fraction and exponential models predict bio-excretion factor =0.021 of activity/day (~0.25 physical decay factor=0.083 of activity/day); significant with measured values.

We conclude that emitted radiation from remnant ¹³¹I will destroy thyroid functioning cells, reducing their ability to produce and excrete hormones, and hence increase biological half-life. Thyroid cells will be subjected to radiation hazards (beta and gamma) for 10 physical half-lives =80day (remnant activity=0.1% of initial value). Caution is required with pregnant and breast feeding women.

SP038 - Dosimetry of Non-Standard Fields

TRACK 05: DOSIMETRY AND RADIATION PROTECTION

SP038.1 - Determination of small photon field quality correction factors using EBT3 radiochromic film

Author(s): Ilias Billas, Hugo Bouchard

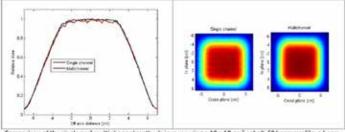

Radiation Dosimetry, National Physical Laboratory, London/UNITED KINGDOM

With the upcoming IAEA-AAPM reference dosimetry protocol on small photon fields, quality correction factor data is needed. To determine these factors accurately, Monte Carlo methods are used but reliable experimental methods remain under investigation. Among the different detectors recommended by IAEA-AAPM for such conditions, radiochromic film remains promising with its high resolution and water-equivalence. However, current methods and film models available commercially (EBT3) focused on clinical applications do not meet the accuracy standards of reference dosimetry, contrary to previous models as shown in literature. The goal of this work is to develop a reliable approach for radiochromic film dosimetry, reaching 0.5% statistical uncertainty on relative pixel dose with EBT3 and reducing systematic errors caused by film thickness inhomogeneity.

An original multichannel method is developed based on a simple 2D model of the film response to dose and thickness and statistical analysis of the calibrated film. Gafchromic EBT3 films are irradiated with cobalt-60 beams homogenously, allowing obtaining parameters for scanner homogeneity correction, multichannel analysis and dose response calibration. Software is developed for film characterization and analysis. Dose distribution measurements are compared to reference data and an uncertainty budget is made to quantify the performance of the method in correcting systematic errors in film response. Based on the analysis, conditions to achieve 0.5% uncertainty in relative measurements are determined. Systematic errors are compared to the statistical behaviour of pixel dose.

Comparing single and multichannel methods, it is demonstrated that the proposed method reduces systematic errors significantly. The method allows uncertainties in output factors of 1.2% for single measurements and 0.4% for measurements repeated ten times. Comparisons with known dose distributions show systematic errors up to 10% with single channel analysis, while they are on average diminished by a factor up to three and well below statistical uncertainties with the multichannel method. The figure shows a comparison of the methods in measuring a 10 x 10 cm² cobalt-60 beam profile: a beam profile (left) and a dose map (right).

Results suggest that a controlled experimental procedure and proper analysis yield great potential for small photon field dosimetry using radiochromic film, with uncertainties in quality correction factors comparable to previous film models. It is expected that future experiments with small photon fields will validate the theoretical predictions reported herein.

Comparison of the single and multi channel methods in measuring a 10 x 10 cm² cobalt-60 beam profile: a beam profile (left) and a dose map (right).

SP038.2 - On the physics of megavoltage small photon field dosimetry

Author(s): <u>Hugo Bouchard</u>¹, Jan Seuntjens², Yuji Kamio³, Simon Duane¹, Hugo Palmans¹

¹Radiation Dosimetry, National Physical Laboratory, London/ UNITED KINGDOM, ²Medical Physics, McGill University, Montreal/ CANADA, ³CHUM, Montreal/CANADA

The upcoming IAEA-AAPM protocol for dosimetry of small photon fields is expected to improve the calibration of such beams, benefitting patient safety and treatment outcome. As a complement to such procedures, a clear presentation of the main effects responsible for large detector correction factors is highly valuable. The physics of small fields is a rather complex subject and has not yet been treated in the literature in a conceptually sound manner. Hence, confusion over the limitations of dosimetry protocols in small fields still exists. The present study aims to provide a comprehensive explanation why dosimetry of megavoltage small photon fields can require significant quality correction factors.

Several concepts are reviewed from a theoretical point of view. The applicability of cavity theory to small fields is described, and a simpler cavity theory is proposed. The concept of charged particle equilibrium (CPE) and its impact on dosimetry is evaluated in detail. The perturbations caused by the presence of a detector are also analysed thoroughly. Four main effects are identified and related to detector characteristics: 1) the density of the cavity material, 2) the atomic properties of the cavity material, 3) the presence of extracameral components and 4) volume averaging effects. The theory is supported by a series of Monte Carlo calculations characterizing detector response to pencil photon beams.

The analysis and results presented here clarify several misconceptions in some of the existing literature on small field dosimetry. Evaluation of the four perturbation effects indicates that significant correction factors arise mainly from the interplay between lack of CPE and cavity density. New Monte Carlo results as well as key publications on the topic strongly support this conclusion. Figure 1 shows simulated detector dose response to a pencil beam under Fano's conditions, and illustrates the interplay between lack of CPE and cavity density.

This study presents an analysis of the physics of small field dosimetry and allows in-depth clarification of the reasons for significant quality correction factors in megavoltage small photon fields. It is expected to be a valuable complement to the upcoming dosimetry protocol which mainly focuses on the technical aspects of small field dosimetry.

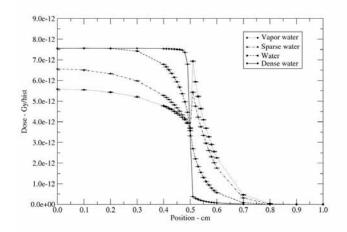

Figure 1. Dose response of a cylindrical cavity, 1 cm diameter, to a 1.25 MeV monoenergetic photon pencil beam, as a function of beam distance from the cavity axis. Calculations are performed using Fano calculations so that the integral of the curve is independent of the cavity density.

SP038.3 - Comparison of AAPM TG 148 and UK code of practice of Reference dosimetry in Helical Tomotherapy. Author(s): <u>Siji Paul</u>, S V. Jamema, Reena Devi, Kishore Joshi, Mayur Sawant, Pooja Moundekar, Deepak Deshpande Medical Physics, Tata Memorial Centre, Mumbai/INDIA

Purpose: To compare AAPM TG 148 and UK code of practice for reference dosimetry of Helical Tomotherapy and to implement and validate a protocol for the beam output measurements.

Methods: Static beam output measurements were carried out using two formalisms AAPM TG 148 and UK code of practice, using two chambers A1SL (Standard imaging) and FC 65G (Scanditronix IBA). According to the UK code of practice, first, tissue phantom ratio TPRTomo for a static 5 × 10 cm² field at an SCD of 85 cm, at depths of 10 cm and 20 cm was measured, followed by conversion of TPRTomo to QITomo using an empirical formula given in the formalism. The absorbed dose to water calibration coefficient for the chamber, ND,w, was determined for QITomo, followed by beam quality correction factor for AISL chamber using this formalism. AAPM TG148 proposed machine-specific reference (msr) field, which is nothing but, a static field that uses reference conditions achievable on a helical tomotherapy machine, 5x10 cm² field size at an SSD of 85 cm. In the AAPM TG 148 formalism, PDD10 was measured at 10cm depth for msr, which was then converted to PDD10 for TG -51 reference conditions using a polynomial, followed by the determination of absorbed dose to water conversion factor, kQ,Q0 x kQ, msr,Q (fmsr,fref) which converts the calibration factor from calibration beam to the machine-specific reference beam.

Results: The difference between the two protocols in the determination of absorbed dose to water(Dw) in the reference conditions was found to be 0.6% and 0.9% for AISL and FC 65G chamber respectively (Table 1). The difference in kQ, msr for the reference conditions between the protocols was 0.1 and 0.2% for AISL and FC65G respectively.

Conclusion: The new code of practice of beam output measurement using reference conditions has been successfully implemented. The choice of ionization chambers, determination of dosimetric corrections, and derivation of absorbed dose to water calibration factors, and the choice of appropriate chamber correction factors described in these formalisms have been found to be practical and implementable.

Table 1: Summary of the difference between TG 148 and UK protocols						
protocol	Chamber	KQ,msr	ND,w,fmsr(cGy/ nC)	Output cGy/min	Ratio	
TG148	A1SL	0.998	58.03	848.99	0.994	
UK	AISL	0.999	58.03	854.3		
TG148	FC65G	0.9996	48.17	828.3	0.991	
UK	FC65G	0.9977	48.17	835.4		

SP038.4 - A new facility to support the adaptation of reference dosimetry in the presence of strong magnetic fields Author(s): <u>Simon Duane</u>, James Manning, Giuseppe Schettino, Hugo Bouchard

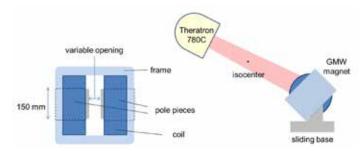

Radiation Dosimetry, National Physical Laboratory, London/UNITED KINGDOM

Novel technology integrating MRI with the delivery of megavoltage photon radiotherapy promises unique advantages for image guidance. At MRI strengths, magnetic fields can have a significant impact on the dosimetry. To calibrate these new machines, detector dose response must be thoroughly investigated and validated data must be available. However, it remains a challenge to isolate the effect of the magnetic field on dosimeter response. While alanine is a promising nearly water-equivalent detector, its potential as a reference dosimeter in the presence of a strong magnetic field has yet to be demonstrated experimentally.

A new experimental facility, unique among standards laboratories, is set up using a dipole magnet with field strengths up to 2 T in a cobalt-60 beam (see figure). The EPR response of nine 2.4 mm alanine pellets in a 2 x 2 x 2 cm³mini-phantom, irradiated to 20 Gy in 0 T and 2 T fields, is evaluated repeatedly to assure optimal precision. The effect of the magnetic field on absorbed dose to water is determined using a limit approach combining Monte Carlo data and the magnetic field-independence of kerma.

The uniformity of the pellet dose is consistent with expectations given the stack orientation being parallel to the magnetic field and perpendicular to the beam. Doses are averaged for inner pellets, away from the phantom edges. The dose correction in water and its type B uncertainty are estimated from existing Monte Carlo data. The correction kQB,Q0 varies from 0.9897 to 0.9978 over the pellets, with a standard deviation of 0.0030. This gives a mean quality correction factor of 0.9955 with a combined uncertainty of 0.0035 (k=2) at 2 T. This result is consistent with the alanine dose response being only slightly affected by the 2 T magnetic field. It is demonstrated alanine has the potential to serve as a reference detector for the experimental determination of magnetic field quality correction factors.

Combined with alanine/EPR dosimetry, the new experimental facility has the capability of validating Monte Carlo data of detector response in strong magnetic fields. This is expected to impact the robustness of future reference dosimetry protocols adapted for use with MRI-guided radiotherapy machines. Future work includes determining the response of alanine in a wide range of field strengths as well as the characterization of this effect on other detectors.

SP038.5 - The use of ionization chambers and Gafchromic films to determine the reference absorbed dose rate and output factors in a CyberKnife® unit small radiation fields Author(s): Nestor Aragón-Martínez¹, Arnulfo Gómez-Muñoz², Abel Hernández-Guzmán¹, <u>Guerda Massillon-JI</u>¹

¹Instituto De Fisica, Universidad Nacional Autonoma de Mexico, Mexico City/MEXICO, ²Umae Oncología, Centro Médico Nacional Siglo XXI, Mexico City/MEXICO

This work investigated the optimum dosimetric method to measure the absorbed dose to water rate under reference conditions in a CyberKnife® unit using radiochromic film, RCF and three ionization chambers, IC: a) An Exradin A12 associated with a Standard Imaging Supermax 90018 electrometer calibrated at NIST, USA (IC-A12), b) A FC65P Welhöfer Scanditronix (SN2258) coupled with a Dose One (SN17237) electrometer calibrated at IBA, Germany (IC-2258) and c) A FC65P Welhöfer Scanditronix (SN580) connected with a Dose One (SN7969) electrometer calibrated at ININ, Mexico (IC-580). In addition, the output factors for all the fields (12 fields from 5 mm to 60 mm diameter) have been measured using a diode detector NWP484841, Gafchromic film types EBT3 and MD-V3. A Varian® iX linear accelerator was used to measure the correction factor, kfmrs, refQmrs, Qneeded by the IAEA/AAPM new formalism using IC and films. The measurements in the Varian® iX were carried out in a 10cmx10cm field, 10 cm depth in liquid water at 90 cm and 70 cm SSD and in a 5.4cmx5.4cm field, 10 cm depth at 70 cm SSD to simulate the CyberKnife® conditions. Whereas in the CyberKnife® unit, measurements were performed using ionization chambers and both film types at 70 cm SSD and 10 cm depth in its 6 cm diameter reference field, but for the smallest fields, only Gafchromic films were considered. In the 10cmx10cm field and 90 cm SSD, difference up to 2 % in the absorbed dose to water rate was observed, depending where the IC was calibrated, however whitin measurement uncertainties, a maximum discrepancy of 0.6% was observed between kfmrs.refQmrs.Q measured with different detectors. For the dose rate measured in the CyberKnife® unit, good agreements were observed (variation of 0.75% and 1.35% vs 1.78% and 1.92% uncertainties for EBT3 and MD-V3, respectively) between CI-A12 and films. While, difference about 2% (uncertainty of 1.35%-1.47%) were found between CI-A12 and CI-580. For the output factors, good agreements were obtained for all the dosimeters (variation of 0.1%-1.97% vs 2.4% uncertainty for EBT3 and variation of 0.2%-2.48% vs 2.86% uncertainty for MD-V3, k=1). For the smallest field (5 mm), a difference of 7 % was found in the output factor measured with MD-V3 film with respect to others dosimeters, which could possibly be associated to its energy dependence. These results suggest that, the absorbed dose measured at a point within a given field size should be the same, regardless the dosimeter used (CI or RCF) if their dosimetric characteristics are well known. This highlighted the importance of performing dosimetry by controlling all the parameters that could affect the dosimeter response. One can conclude that radiochromic film dosimetry can be considered as an appropriate alternative for measuring absorbed dose to water rate and output factors in small radiation fields and obtain a combined standard uncertainty of less than 2%.

SP039 - ECG

TRACK 09: BIOSIGNAL PROCESSING

SP039.1 - Improved T-wave Alternans Detection in ECG Signals Author(s): <u>Guangyi Chen</u>¹, Sridhar Krishnan¹, Vijay S. Chauhan² ¹Ryerson University, Toronto/CANADA, ²Toronto General Hospital, Toronto/CANADA

T-wave alternans (TWA) is a pattern in electrocardiogram (ECG) signals characterized by two distinct forms of T-waves appearing in alternation, at a patient's heart rate in the range of 90 to 120 beats per minute. There exists a relation between the amount of TWA, the heart rate at which it appears, and the risk of sudden cardiac death (SCD). Therefore, it is important to develop better methods to detect TWA in ECG signals.

In this paper, we enhance an existing method for detecting TWA in ECG signals. We reduce the noise in the ECG signals adaptively by using dual-tree complex wavelet transform (DTCWT). Our method for detecting TWA is based on the Matlab code of the champion (Jubair Sieed) in the 2008 TWA challenge. We modified his Matlab code in a number of ways as shown in the full paper. We briefly describe the steps of our proposed method for detecting TWA in ECG signals here:

1) We perform moderate filtering to the input ECG signal xk(t), just as the original method.

2) Apply wavelet denoising to every ECG signal adaptively.

3) We find the R-peaks in the filtered ECG signal.

4) We claculate the T-peaks and their amplitude.

5) We find the TWA waveform. We use the median instead of the maximum for the T-wave magnitude of each lead.

6) We calculate the T-wave magnitude of the whole ECG signal with multiple leads.

In our experiments, we select to use the ECG signals provided by the 2008 TWA challenge, which contains one hundred multi-channel ECG records sampled at 500 Hz with 16-bit resolution over a \pm 32 mV ranges. We perform comparisons among our proposed method and three existing methods, developed by Jubair Sieed, Renata Simoliunine, and Mahdi Zarrini. They have posted their Matlab codes on the 2008 TWA website. We select four metrics for measuring the quality of the detected T-waves: Spearman rank correlation coefficient, Kendall rank correlation coefficient, root-mean-square-error (RMSE), and cross correlation (CC). From Table 1, it can be seen that our proposed method performs the best, compared to the three existing methods.

Table 1. A comparison among three existing methods and the proposed method for detecting TWA in ECG signals. The best scores are highlighted in bold font.

Method	Spearman	Kendall	RMSE	CC
Jubair Sieed	0.6496	0.5156	21.7358	0.6580
Renata Simoliunine	0.3836	0.2868	22.6790	0.6187
Mahdi Zarrini	0.5034	0.3495	24.8296	0.5100
Proposed	0.7072	0.5861	20.4036	0.7074

SP039.2 - Electrical Left Atrial Conduction Delay with Focused Transesophageal Electrocardiography in Cardiac Resynchronization Therapy

Author(s): <u>Matthias Heinke</u>¹, Helmut Kühnert², Tobias Heinke³, Jonas Tumampos¹, Gudrun Dannberg²

¹Electrical And Information Technology, Medical Engineering, University od Applied Sciences Offenburg, Offenburg/GERMANY, ²Department Of Internal Medicine I, University of Jena, Jena/GERMA-NY, ³Healthcare Sector, Siemens AG, Rudolstadt/GERMANY

Cardiac resynchronization therapy (CRT) is an established biventricular pacing therapy in heart failure patients with left bundle branch block and reduced left ventricular ejection fraction, but not all patients improved clinically as CRT responder. Purpose of the study was to evaluate electrical left atrial conduction delay (LACD) with focused transesophageal electrocardiography in CRT responder and CRT non-responder.

Methods: Twenty heart failure patients (age 66.6±8.2 years; 2 females, 18 males) with New York Heart Association functional class 3.0±0.3 and 174.2±40.2ms QRS duration were analysed using posterior left atrial transesophageal electrocardiography with hemispherical electrodes. Electrical LACD was measured between onset and offset of transesophageal left atrial signal before implantation of CRT devices.

Results: Electrical LACD could be evaluated by bipolar transesophageal left atrial electrocardiography using TO Osypka electrode in all heart failure patients with negative correlation between 54.7 ± 18.1 ms LACD and $24.9\pm6.4\%$ left ventricular ejection fraction (r=-0.65, P=0.002). There were 16 CRT responders with reduction of New York Heart Association functional class from 3.0 ± 0.29 to 2.1 ± 0.2 (r=0.522, P=0.038) during 9.41 ± 10.96 month biventricular pacing and negative correlation between 49.6 ± 14.2 ms LACD and $26.0\pm6.2\%$ left ventricular ejection fraction (r=-0.533, P=0.034). There were 4 CRT non-responders with no reduction of New York Heart Association functional class from 3.0 ± 0.4 to 2.8 ± 0.5 (r=0.816, P=0.184) during with 13.88\pm16.39 month biventricular pacing and no correlation between 75.25±19.17ms LACD and $20.75\pm6.4\%$ left ventricular ejection fraction (r=-0.831, P=0.169).

Conclusions: Focused transesophageal left atrial electrocardiography can be utilized to analyse electrical LACD in heart failure patients. LACD correlated negative with left ventricular ejection fraction in CRT responders. LACD may be a useful parameter to evaluate electrical left atrial desynchronization in heart failure patients.

SP039.3 - Electrical Interatrial to Interventricular Conduction Delay Ratio with Focused Transesophageal Electrocardiography in Cardiac Resynchronization Therapy

Author(s): <u>Matthias Heinke</u>¹, Gudrun Dannberg², Tobias Heinke³, Bruno Ismer¹, Tobias Haber¹, Jonas Tumampos¹, Helmut Kühnert² ¹Electrical And Information Technology, Medical Engineering, University od Applied Sciences Offenburg, Offenburg/GERMANY, ²Department Of Internal Medicine I, University of Jena, Jena/GERMA-NY, ³Healthcare Sector, Siemens AG, Rudolstadt/GERMANY

can be utilized for diagnosis of volunteers with high-risk.

Cardiac resynchronization therapy (CRT) is an established class I level A biventricular pacing therapy in chronic heart failure patients with left bundle branch block and reduced left ventricular ejection fraction, but not all patients improved clinically. Purpose of the study was to evaluate electrical interatrial conduction delay (IACD) to interventricular conduction delay (IVCD) ratio with focused transesophageal left atrial and left ventricular electrocardiography.

Methods: Thirty eight chronic heart failure patients (age 63.4 ± 10.2 years; 3 females, 35 males) with New York Heart Association (NYHA) functional class 3.0 ± 0.2 and 171.71 ± 36.17 ms QRS duration were analysed using posterior left atrial and left ventricular transesophageal electrocardiog-raphy with hemispherical electrodes before CRT. Electrical IACD was measured between onset of P-wave in the surface ECG and onset of left atrial signal. Electrical IVCD was measured between onset of left ventricular transector and onset of left ventricular transector and onset of left ventricular transector was measured between onset of QRS complex in the surface ECG and onset of left ventricular signal.

Results: Electrical IACD and IVCD could be evaluated by transesophageal left atrial and left ventricular electrocardiog-raphy in all heart failure patients with correlation to 1.18 ± 0.92 IACD-IVCD-ratio (r=-0.57, P<0.001; r=0.66, P<0.001). There were 32 CRT responder with reduction of NYHA class from 3.0 ± 0.22 to 1.97 ± 0.31 (P<0.001) during 16.5 ± 18.9 month CRT with 75.19 ±33.49 ms IACD, 78.91 ±24.73 ms IVCD, 1.04 ± 0.66 IACD-IVCD-ratio and correlation between IACD and IACD-IVCD-ratio (r=0.84, P<0.001). There were 6 CRT non-responder with no reduction of NYHA class from 3.0 ± 0.3 to 2.9 ± 0.5 during 14.3 ± 13.7 month biventricular pacing, 50.0 ± 28.26 ms IVCD (P=0.014), 1.92 ± 1.65 IACD-IVCD-ratio (P=0.029) and correlation between 67.0 ±24.9 ms IACD and IACD-IVCD-ratio (r=0.85, P=0.031).

Conclusions: Focused transesophageal left atrial and left ventricular electrocardiography can be utilized to analyse electrical IACD and IVCD in heart failure patients. IACD-IVDC-ratio may be a useful parameter to evaluate electrical left cardiac desynchronization in heart failure patients.

SP039.4 - Analytical geometry based parameters for studying repolarization variability in patients with myocardial infarction Author(s): Muhammad A. Hasan, Sridhar Krishnan

Electrical And Computer Engineering, Ryerson University, TORON-TO/ON/CANADA

Myocardial infarction (MI) is one of the leading causes of mortality throughout the world [1]. About 69,000 Canadians and 600,000 people in the United States die as a result of heart attack every year [2]. The myocardium cells of the heart are altered in ventricular repolarization after MI. Thus, studying variability in ventricular repolarization on a beat-by-beat basis has gained significant interest from clinicians and basic scientists. Indeed, the T-wave in the ECG signal refers to the ventricular repolarization and is believed to be a predictor for the risk of ventricular arrhythmias [3]. However, the beat-to-beat repolarization variability in MI patients has not been fully understood. Therefore, the purpose of this research is to study the beat-to-beat repolarization variability and to assess the predictive capabilities of geometry based parameters for studying repolarization variability in MI patients (79 patients) compared to healthy subjects (69 subjects). To study the beat-to-beat repolarization variability, we extracted some geometrical based T-wave parameters [T-wave amplitudes (h), distances between Q-wave onset to T-wave max (Q2Tmax), angles between T-wave max and T-wave end with respect to Q-wave (TmaxQTend)] as shown in Figure 1. The detailed methodology have been described in our recent article [3]. We quantified the standard deviation of the extracted parameters as a marker of repolarization variability, respectively for both MI patients and healthy subjects. Beat-to-beat repolarization variability (in all three extracted parameters) was found to be significantly higher in MI patients compared to healthy subjects. In conclusion, this research shows that the geometrical based parameters for repolarization variability may provide markers for separating MI patients and

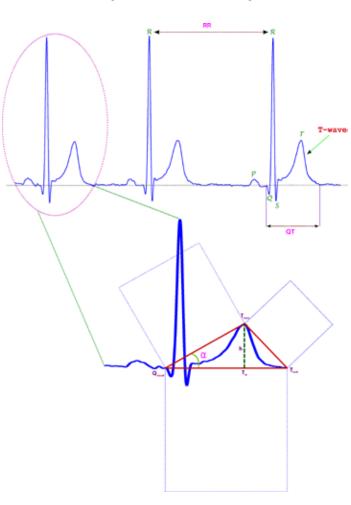

Figure 1: Beat-to-beat ECG. The computation of geometrical based T-wave parameters: T-wave amplitude (h), distances between Q-wave onset to T-wave max (Q2Tmax), angle between T-wave max and T-wave end with respect-to-Q-wave (TmaxQTend)[3].

SP039.5 - Acute Mental Stress Detection via Ultra-short term HRV Analysis

Author(s): <u>Rossana Castaldo</u>¹, Leandro Pecchia¹, Paolo Melillo² ¹School Of Engineering, University of Warwick, Coventry/UNITED KINGDOM, ²Multidisciplinary Department Of Medical, Surgical And Dental Sciences, Second University of Naples, Naples/ITALY

Background: Acute mental stress reduces working performances and it is one of the first causes of cognitive dysfunctions, cardiovascular disorders and depression. Stress detection via short-term (5 minutes) Heart Rate Variability (HRV) analysis has been widely investigated in the last years. Recent improvements in wearable sensing devices and mobile computing raised a new research question: is ultra-short (2 minutes) HRV analysis as effective as the short-term analysis to detect mental stress? This study aimed to answer this research question.

Methods: Short and ultra-short HRV analysis were compared in 42 healthy subjects (age 25-38 year) undertaking the widely adopted and highly-effective Stroop Color Word Test (CWT). HRV was extracted by ECG signals recorded during rest and stress session using a chest wearable monitoring device, the BioHarness M3 (ZephyrTech, NZ). According to previous literature on HRV and mental stress, 18 HRV measures were extracted and analyzed using validated software tools. However, among the 18 HRV measures, only those that changed significantly in the short-term were also investigated in the ultra-short term analysis. Variations in HRV measures in short and ultra-short term were compared using the statistical Wilcoxon significance test, because several measures were not normally distributed.

Results: The results of the current study proved that among the 18 HRV measures investigated, 10 HRV measures resulted significantly changed in the short-term analysis during mental stress. Among such 10 HRV measures, only 6 HRV measures presented a consistent behavior in the short and ultra-short registration: Mean RR, Low Frequency power (LF), Sample Entropy (Sampen), Short term and Long term fluctuation slope of Detrended fluctuation analysis (dfa1, dfa2) and Mean line length of Recurrence plot analysis (RPImean). Particularly, Mean RR and dfa1 significantly increased during stress, while the other significantly decreased. In contrast, the remaining 4 HRV measures, changed significantly in the 5 min analysis but not in the 2 min analysis, although the trends were consistent. In fact, the ratio of LF and High Frequency power (HF) resulted increased during stress, while Correlation dimension (D2), Recurrence rate (REC) and Shannon Entropy (ShanEn) decreased. This can be explained by the fact that in less than 5 minutes the number of RR recorded is too low in order to observe significant changes. This can be verified enrolling more volunteers.

Conclusion: The current study showed that among the 18 HRV measures investigated, 10 resulted significantly changed during mental stress. However among those, only 6 changed consistently both in the short and ultra-short HRV analysis, while 4 resulted to be not significant in ultra-short term. This evidence suggested that in the shift from short to ultra-short HRV analysis, not all the features can be equally used and therefore further studies are needed to prove that HRV measures change significantly even during stress in the ultra-short term.

SP039.6 - Classification of Abdominal Fetal Electrocardiogram Recordings using Karhunen-Loève Decomposition

Author(s): <u>Philip A. Warrick</u>¹, Miguel A. Altuve² ¹Medical Research And Development, PeriGen Inc., Montreal/ CANADA, ²Facultad De Ingeniería Electrónica, Universidad Pontificia Bolivariana, Bucaramanga/COLOMBIA

Maternal abdominal ECG acquisition is a non-invasive technique not usually common in clinical practice but with a growing interest since it could provide enough information to explore the cardiovascular condition of the fetus after the 20th week of gestation. Since the maternal and fetal cardiac activities are combined in the ECG signal, several challenges have to be surmounted to obtain a useful fetal ECG signal from the maternal abdominal ECG like the overlapping observed in time and in frequency of both components and the low signal-to-noise ratio of the signal. In the present study, the maternal and fetal activities were exploited through the decomposition of maternal abdominal ECG recordings using the Karhunen-Loève (KL) transform. Then, several feature sets extracted from the KL decomposition and from the ECG signal were combined in support vector machines classifiers to detect the presence and absence of a maternal and/or a fetal QRS complex from ECG segments of 250 ms duration. Results show that a fetal QRS complex was well detected when there was not overlap with a maternal QRS (sensitivity 88.8%, specificity 97.1%) while detection diminished somewhat when overlapping was present (sensitivity 90.7%, specificity 75.9%). Detecting maternal activity using the KL decomposition was a relatively simple task; the main goal of detecting the fetal activity was effectively achieved when the fetus activity occurred in isolation, but was a more difficult task when accompanied by temporally adjacent maternal activity.

SP039.7 - Dictionary Learning Algorithms For The Application Of Ventricular Arrhythmia Classification.

Author(s): Iman Kalaji¹, Krishnanand Balasundaram², Karthi Umapathy²

¹Electrical And Computer Engineering Dept., Ryerson University, Toronto/ON/CANADA, ²Electrical And Computer Engineering Dept., Ryerson University, Toronto/CANADA

Background:

The classification of cardiac arrhythmias such as ventricular tachycardia (VT) and ventricular fibrillation (VF) has been an important research topic in the signal processing field due to its lethal effects. Therefore, it is important to classify arrhythmias to deliver the appropriate treatments and prevent sudden cardiac arrests. Researchers presented an automated algorithm that express non-stationary signals by decomposing them into a linear expansion of different known mathematical functions that are well localized in both time and frequency domains. A family of the mathematical functions (atoms) creates a dictionary; the choice of the dictionary plays an important role in an accurate representation. Hence, researchers developed dictionary learning algorithms to create a learned dictionary using a training data to adapt its content to the given signals such that it provides a better approximation from an over complete redundant dictionary. In this work, due to the non-stationary nature of the electrocardiogram (ECG) signals during an arrhythmic event, these existing algorithms were used to classify between VT and VF signals using the dictionary learning algorithm LC-KSVD. Nine hundred and forty four surface ECG signal segments (four seconds each) from the MIT-BIH database were used for the classification derived from twenty three VF signals and ten VT signals.

Methodology:

The dictionary learning algorithm that is used in this study is called label consistent K-SVD. In the LC-KSVD algorithm, a discriminative dictionary is learned for sparse coding. It uses a class label of a training data as well as it associates label information with each dictionary item to enforce discriminality in sparse codes during the dictionary learning process (same class signals has similar sparse coding). Furthermore, it uses a label consistency constraint called "discriminative sparse-code error" and combines it with the reconstruction error and the classification error to form an objective function. The optimal solution of the objective function is efficiently obtained using the K-SVD Algorithm. This algorithm learns the dictionary, discriminative coding parameters, and classifier parameters for optimal linear classifier simultaneously.

Results and Conclusion:

Based on our analysis using the LC-KSVD algorithm to train an over complete hybrid dictionary consisting of cosine, symlet4, daubechie4 wavelet atoms, we were able to classify the VF and VT signals with an average of accuracy of 70.8% using LDA classifier. The results were validated with four fold cross-validations.

TRACK 10: REHABILITATION MEDICINE, SPORTS MEDICINE, REHABILITATION ENGINEERING AND PROSTHETICS

SP040.1 - Working to live: The use of field studies and simulations to make workplaces safer Author(s): <u>Michele Oliver</u>

School Of Engineering, University of Guelph, Guelph/ON/CANADA

Working to live: The use of field studies and simulations to make workplaces safer

Employers want to reduce accidents and overuse injuries amongst their workers but often they don't possess the required tools and information so they need to turn to research for answers. From a research perspective, first you need to understand the problem and then you can design a solution that will have the greatest impact in reducing or eliminating the problem. This can be accomplished through a combination of field and laboratory studies. To illustrate this I will present results from a series of laboratory and field studies designed to assess and solve occupational problems primarily amongst operators of heavy mobile equipment.

The thought process and studies that went into the design and development of a heavy equipment dynamic armrest will be described. The armrest was designed to translate and rotate in order to mimic natural pendulation of an operator's arm thus minimizing upper limb and neck muscle activity as they operate joystick controls.

Results from a comprehensive field study which concurrently assessed the biomechanical and physiological requirements of overhead crane cab operation in a steel mill will be discussed as will the companion study which utilized the results of the field study to set up a laboratory based simulation in order to determine if a camera based system could reduce musculoskeletal loading in the trunk, arms and neck for crane cab operators by allowing them to maintain a more neutral posture.

The final set of studies I will discuss describe the results of a series of field to lab to field methodologies developed to intelligently retrofit seats used in steel manufacturing mobile equipment in order to minimize operator exposure to whole-body vibration. When companies retrofit machines, seats are usually selected and implemented without an evaluation process based on actual machine and/or terrain specific vibration inputs to assess seat efficacy. In general, operators test and choose seats from a showroom rather than testing them in operating machines. Our research team utilized a person rated hexapod robot simulator to replicate field-based machine specific vibration to evaluate several commercially available seats to identify the best seat for the workplace application. The selected seat was successfully introduced back into the workplace resulting in reduced vibration exposure and improved worker comfort.

Finally, I will talk briefly about some of the ongoing work with our new driving and hexapod robot heavy equipment simulator facilities which bring together a multidisciplinary team of researchers from engineering, computer science and psychology. SP040.2 - Pitch movement acceleration measures during the practice of virtual games in adolescents with Down syndrome Author(s): Daniela Carrogi-Vianna¹, <u>Paulo B. Lopes²</u>, Raquel Cymrot², Jefferson J.H. Almeida², Marcos L. Yazaki², Silvana Maria Blascovi-Assis³

¹Post Graduation In Developmental Disorders, Universidade Paulista and Universidade Presbiteriana Mackenzie, Sorocaba - São Paulo/ BRAZIL, ²School Of Engineering, Universidade Presbiteriana Mackenzie, São Paulo/BRAZIL, ³Post Graduation In Developmental Disorders, Universidade Presbiteriana Mackenzie, São Paulo/BRAZIL

I. INTRODUCTION

Adolescents with Down syndrome (DS) present a range of motor difficulties. Therefore they do not specify a temporal-spatial pattern of muscle contractions, causing major difficulties to perform a task in time.

The Virtual Reality (VR) has been regularly used as a method of physical rehabilitation, which is based on the use of virtual games in order to enable the function of people with several types of disabilities.

The Nintendo[®] Wii[™] console is the most used in the virtual rehabilitation of people with multiple disabilities.

The accelerometry has been used to stablish measures of human movement, since it is an inexpensive, effective and feasible method, which has been widely used in scientific researches.

II. OBJECTIVE

Evaluating the characteristics of movement acceleration of upper limbs for adolescents with DS and adolescents with typical development, by playing bowling and golf of Nintendo[®] Wii[™].

III. CASE STUDY AND METHOD

The study evaluated 21 adolescents diagnosed with DS (FDSG and MDSG) and 33 with typical development (FCG and MCG), of both genders (F and M), aged between 10 and 14. The data was gathered by using wireless capacitive triaxial accelerometers.

IV. RESULTS

For the data analysis, four groups were submitted to normality adherence tests, separate by gender.

A. Bowling game

In the significance level of 10%, there was adherence to the normal distribution of the maximum peaks of acceleration obtained by the four groups. The Medium acceleration per group were: FCG 70.51; MCG 70.37; FDSG 37.24; MDSG 45.33.

It was concluded that the groups presented significant statistical differences, with higher peaks of acceleration for MCG and FCG when they are compared with MDSG and FDSG.

B. Golf game

In the significance level of 10%, there was adherence to the normal distribution of the maximum peaks of acceleration, obtained by the three groups (FCG, MCG, FDSG). In the significance level of 10% there was no adherence to the Normal Distribution of the maximum peaks of acceleration for MDSG. The Medium acceleration per group were: FCG 56.80; MCG 74.80; FDSG 30.52; MDSG 45.12.

It was concluded that the groups presented significant statistical differences, with the highest peak of acceleration for the boys groups, which had superior average compared to the girls group, observed in both MCG and FCG, as well as in MDSG and in FDSG.

V. CONCLUSIONS

By efficiently using the accelerometry, it was possible to evaluate

the characteristics of the movement acceleration of the superior limbs of the population diagnosed with DS during the virtual bowling and golf games, using the Nintendo[®] Wii[™] console. It was observed a better performance in every single evaluation for the control group, having lower acceleration in the movement of adolescents with DS. It was concluded that the use of Nintendo[®] Wii[™] associated with the accelerometry technique may be an effective resource to evaluate movement acceleration patterns in population with DS.

SP040.3 - Movement Training and Assessment with 3D Virtual Reality for Parkinson's Disease Patient

Author(s): <u>Chien-An Chen</u>¹, Hsiao-Yu Lee², Zong-Syuan Huang¹, Chao-Chen Lo¹, Jia-Jin Chen¹, Yu-Lin Wang³, Kao-Chang Lin³ ¹Biomedical Engineering, National Cheng Kung University, Tainan/ TAIWAN, ²Far East University, Tainan/TAIWAN, ³Chi Mei Hospital, Tainan/TAIWAN

Balance problems such as inability to maintain stability and postural transition are common in patients with Parkinson's Disease (PD). In clinical, visual cues are used as rehabilitation program in improving postural stability. Ball catching movement is considered a kind of suitable training program for PD patients because of its characteristics of eye-hand-foot coordination. Furthermore, studies have shown that optical flow could provide motion perceptions and improve movement performance of PD patients. The purpose of this study was to develop a 3D virtual reality (VR) training system for providing optical flow information during catching virtual balls under standing and one-step forward movements for subjects with PD. Fifteen PD participants were recruited from local medical center. The effects of optical flow on postural stability were evaluated by standing and one-step forward task using our 3D VR system providing virtual catching ball with and without optical flow. The arm-trunk movement and trunk movement were utilized as the assessment indices of balance and postural control by inertial sensors attached on waist and bilateral of wrists. Our results showed better arm-trunk coordination and higher similarity of arm symmetry with smoother movement pattern, greater trunk sway, and better postural stability index under the standing task with optical flow. Moreover, PD patients also spent substantially less duration prior to gait initiation and achieved greater inclination angle on one-step forward task. The balance training system accompanied with evaluation system demonstrated that arm-trunk control and balance on ball catching performance of PD patients could be improved with optical flow information.

SP040.4 - Arm angle detection in egocentric video of upper extremity tasks

Author(s): Jirapat Likitlersuang, José Zariffa

Institute Of Biomaterials And Biomedical Engineering (ibbme), University of Toronto, Toronto/ON/CANADA

Background: Upper limb function is fundamental to most activities of daily living (ADL), and can be dramatically impaired after neurological injuries, such as spinal cord injury. Currently there is no viable method to assess and monitor hand function once the patient has returned to the community after rehabilitation. Our solution is to track hand use in the community by developing a computer vision (CV)-based wearable sensor using egocentric cameras, in order to capture information about a person's level of independence and reliance on attendant care. Such a system needs to be able to differentiate object manipulations performed by the user from those performed by a caregiver, as well as the user's right and left hands. The angle of the arm in the video is important in this classification. Here we describe and compare three methods for detecting arm angles in egocentric view. **Methods:**Following hand detection, Method I uses a Haar-like feature to compare the contents of a rectangle extending from the hand to two parallel rectangles on either side, rotating these through 360 degree range. Method II is based on Hough line transforms and attempts to determine which of the detected lines passing though the hand correspond to the edges of the sleeve. Method III detects the contour of the sleeve based on a colour histogram obtained through a calibration step. A least squares fit is then applied to the detected sleeve to determine the angle of the arm. The three methods were tested by comparing their output to manually measured angles, in 120 frames of recorded egocentric video consisting of 4 ADLs from 3 different able-bodied subjects. Results: Based on absolute error, Method III was shown to have the best performance with a mean absolute error of 23.70 ± 22.89 degrees. This was followed by Method I with the mean absolute error of 34.79 ± 38.48 degrees and Method II with the mean absolute error of 68.76 ± 58.01 degrees (Fig. 1). Conclusion: While Method III had the smallest error, it required a calibration step to determine the colour of the sleeve, and this makes this method less practical compared to Method I, which does not require any calibration and still had a comparable error. We have demonstrated that a Haar-like feature method can easily be integrated with hand detection to determine arm angle in an egocentric CV-based wearable sensor for detecting hand usage at home.

SP040.5 - Development of an image-based calibration technique for use with non-ideal postures in the assessment of kinematics using wearable sensors

Author(s): Jan Andrysek, Monica D. Gomez

Institute Of Biomaterials And Biomedical Engineering, University of Toronto, Toronto/ON/CANADA

Introduction

Wearable sensors are emerging low-cost alternatives to expand the current gold-standard camera-based assessment of kinematics, allowing for measurements in real-life conditions and environments. MVN BIOMECH Awinda system is an example of a commercial wearable sensor system used to analyze whole body kinematics. However, to calibrate the device, an ideal upright position known as "Neutral Posture," or "N-Pose," must be attained. Hence, these sensors have limitations in the rehab field where muscle weakness, bone deformity, sensory loss, pain or impaired control hinders or makes it impossible to attain N-Pose. Developing a calibration technique that adjusts the model to account for actual orientation and position of body segments, versus the assumed N-Pose, will improve the estimation of kinematics. Therefore, this study aims to produce calibration parameters which will be used to adjust the "N-

Pose". Here, Kinect sensor is used to extract body segment lengths, knee, hip and ankle angles as the calibration parameters.

Research Objectives

Obj.1 Understand how non-ideal calibration postures affect the accuracy of lower body kinematics estimation.

Obj.2 Develop an image-based calibration technique using Kinect to acquire calibration parameters.

Methods

Obj.1 A pilot study was conducted to assess the accuracy of knee and ankle angles in the sagittal plane of a participant's gait. The MVN BIOMECH Awinda system was used to measure patient's kinematics after calibrating the system with **a**) the N-Pose and two non-ideal calibration postures: **b**) bent knees and **c**) standing on tip-toes.

Obj.2 The depth sensor Kinect for Windows is used to determine the position of optical markers placed on participant's body landmarks. With this information, distance between markers is estimated and then used to find joint centers. Next, joint centers are connected to form lines that will represent the body segments, and from these segment lines angles are calculated using the dot product to find the angle between two vectors. In combination with these positions and angles (calibration parameters), sensor data collected from participant's gait using the MVN BIOMECH's lower body configuration are used to re-estimate gait kinematics.

Preliminary Results

Obj.1 Results showed that for both cases the difference between angles obtained in (a) and (b) (40.88degrees) and (a) and (c) (53.88 degrees) is consistent throughout the gait cycle; and the coefficients of multiple correlation [3] represent good level of similarity between (a) and (b) (0.98) and between (a) and (c) (0.93). These results show that the inaccuracy of kinematics after calibrating with non-ideal postures is mainly due to the offset between waveforms. This suggests that the proposed calibration technique for Obj. 2, which is in design stage, can provide a good solution for the calibration problem.

Clinical Significance

Improving the calibration process of these wearable systems to account for non-ideal postures makes them suitable for a variety of patient populations. This technique will ultimately provide clinicians and researchers with a valuable tool to analyze the kinematics in real life environments.

SP041 - Brain Computer/Machine Interfaces

TRACK 11: NEUROENGINEERING, NEURAL SYSTEMS

SP041.1 - Cross-subject and Cross-gender Emotion Classification from EEG

Author(s): Jia-Yi Zhu, Wei-Long Zheng, <u>Bao-Liang Lu</u> Computer Science And Engineering, Shanghai Jiao Tong University, Shanghai/CHINA

Emotion is a general definition for subjective cognition experiences, including psychological and physiological states aroused by one's feeling, thinking, and behaviors. With the development of artificial intelligence, affective computing based on computer systems is considered to make human-machine interaction more friendly and convenient. Recently, progresses of brain-computer technology encourage researches on EEG-based emotion recognition in the field of neuroengineering. Previous studies have indicated that EEG does change with emotional states in specific patterns. To our best knowledge, however, EEG models used in the existing studies were almost subject-dependent. Thus, there is no definite conclusion on whether these patterns are universal across different subjects.

The main goals of this study are to find a subject-independent EEG model for emotion classification and examine gender differences of EEG patterns as one of the major factors affecting the performance of cross-subject models. In this paper, we use movie clips as stimuli to evoke three emotional states: positive, neutral, and negative. We adopt differential entropy as features, and apply linear dynamic system to do feature smoothing. The average in-subject classification accuracy of SVM is 90.97% with five frequency bands on 15 subjects (7 males and 8 females), while the average cross-subject classification accuracy is 64.82% using data from 14 subjects as training set and data from the rest one subject as testing set. This implies that different persons do share similar patterns for EEG changing with emotions, but there are still some individual differences during emotion processing. We also expand the training set from one subject to 14 subjects and find the average accuracy will then continuously increase with some slight ups and downs. Therefore, we can get an observation: A universally applicable EEG model for emotion recognition can be trained using data collected from enough subjects. Moreover, fuzzy-integral-based combination method is used to combine models across frequency bands and get an average improvement of 8%.

We choose data from the same or different genders to do crossgender emotion classification, seeing Fig. 1. The better performance of using training and testing samples both from female subjects partly implies that there must be gender differences during emotion processing. Also, for female testing subjects, using single female model, or combining male and female models would both improve the performance of cross-subject emotion classification. Moreover, it can be partially illustrated that the universal EEG pattern is likely to behave more obvious among female subjects.

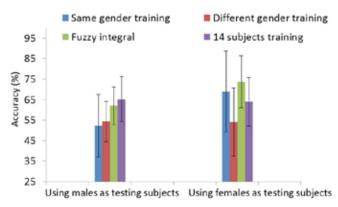

Fig. 1 Average accuracies of cross-gender emotion classification

SP041.2 - Comparison of Classification Methods for EEG-based Emotion Recognition

Author(s): Wei-Long Zheng¹, Roberto Santana², <u>Bao-Liang Lu¹</u> ¹Computer Science And Engineering, Shanghai Jiao Tong University, Shanghai/CHINA, ²University of the Basque Country, San Sebastian/SPAIN

Emotion plays an important role in human communications and decision making. However, the modeling and mechanism of emotions still remain a challenge problem. Besides logical intelligence, emotional intelligence is proposed to narrow down the emotional gap between humans and computers in artificial intelligence. So far, many approaches to emotion recognition have been proposed based on different modalities. Among these approaches, emotion recognition from EEG allows direct assessment of emotional states of users, which has gained more and more attention recently.

In recent years, great progresses in EEG-based emotion recognition have been achieved and various methods have been studied and evaluated. However, a major limitation of these methods is that only a handful of features and classifiers have been compared in each study. Moreover, most studies evaluate their methods on different, usually small datasets, so the results of these studies cannot be compared directly due to different setups of experiments. It is difficult to judge which types of features and classifiers are most suitable for EEG-based emotion recognition. Although recently Jenke et al. performed a systematical comparison of feature extraction and feature selection methods in their work, there is still a lack of detailed comparisons of classification methods for emotion recognition form EEG.

In this paper, we review different classification methods for emotion recognition from EEG and perform a detailed comparison of these methods on a relatively larger dataset of 45 experiments. Since different classifiers could have different discriminative power for emotion classification, we further propose to combine different classifiers using stacking to improve the performance. Experimental results show that the combination of classifiers using stacking can achieve higher accuracies than single classifiers.

To investigate critical brain areas and critical frequency bands for promoting our understanding of emotion processing mechanisms, we perform a contrastive analysis of the weights derived from the classifiers as a way to detect and extract the most relevant features for classification. We find that the relevant features of different classifiers are similar. These results show that most relevant channels locate on the lateral temporal and prefrontal brain areas and the critical frequency bands are beta and gamma bands. Additionally, the weights of Logistic Regression-I2, SVM-linear and SVM-RBF indicate some relevant features in delta bands except for Random Forest.

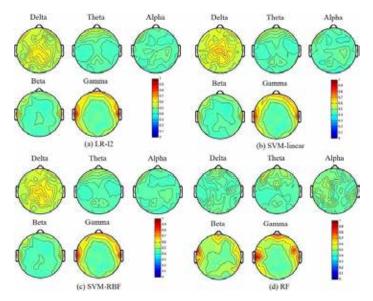

Fig 1. The weight distribution of LR-I2, SVM-linear, SVM-RBF and Random Forest.

SP041.3 - A Brain Computer Interface (BCI) based on intermittent photic-stimulation using multiple coherence to command detection

Author(s): Aluizio D'Affonseca Netto, <u>Antonio M.F.L. Miranda De Sa</u>, Antonio F.C. Infantosi

Biomedical Engineering, Federal University of Rio de Janeiro, RIO DE JANEIRO/BRAZIL

Brain Computer Interfaces (BCI) are systems that are capable of translating information from the neuronal activity of a subject into controlling signals for devices. BCI may be either passive or active. This latter uses evoked responses to external, sensory stimulation (e.g. intermittent photic stimulation). Active BCIs exhibit reduced complexity and processing time in comparison with passive interfaces. This occurs due to the fact that the evoked responses occur at a known stimulation, which simplifies the detection algorithm. The present work aims at using a modified algorithm for the multiple magnitude-squared coherence (MMSC) estimation for increasing both sensibility and specificity of the decision system, as well as to reduce the response time. The algorithms for multiple coherence calculation were developed using the sweep operator over the augmented spectral matrix. The algorithms for real time calculation and for obtaining BCI controlling signals with lowest latency. EEG from five subjects has been collected using the following monopolar derivations according to the 10-20 International System: O1, O2, P3, P4, C3, C4, Pz and Cz. The hardware was developed specifically for BCI interfaces based on visual stimulation. Each subject was seated in a comfortable armchair with a monitor containing four distinct LEDs each of which flickering at a distinct frequency (24, 28, 32 and 36 Hz). The multiple coherence detector was used to determine to which LED the subject was looking at and this result was used for a BCI that controlled the cursor movement. The MMSC-values were calculated with segments of L = 0.25 s of EEG signal segments. The proposed system is capable of detecting responses within a time lag that is below 4.54 s with average area under the ROC curve equal to 0.91. For a 24 Hz stimulation frequency, the system had sensitivity and specificity equal to, respectively, 88.3 % and 73.2 % Fig.1 shows a volunteer controlling the cursor position using the BCI system.

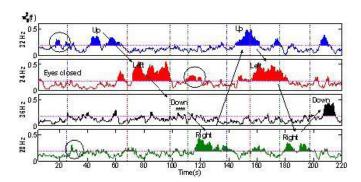

Fig.1: Temporal evolution of the MMSC of a volunteer focusing attention on different stimulus. Horizontal line: detection threshold for a significance level of 5% (0.182). Vertical line indicates the instant of time the volunteer pressed the keyboard indicating the direction of the desired movement to gaze at one of the LEDs (blue for up, red for left, black to green to the right and below). (*) command is not detected, i.e., false negative. The circled is example of false positive. Arrow: sequence of volunteer commands.

SP041.4 - Volitional modulation of neural activity to control a 2 degree-of-freedom brain-machine interface in a rat model Author(s): Martha G. Garcia¹, Hector Vargas-Perez², Mary K.

Nagai³, José Zariffa¹, Milos R. Popovic¹

¹Institute Of Biomaterials And Biomedical Engineering, University of Toronto, Toronto/CANADA, ²Department Of Molecular Genetics, University of Toronto, Toronto/CANADA, ³Toronto Rehabilitation Institute, University Health Network, Toronto/CANADA

Operant conditioning of neural activity is a novel paradigm to control brain-machine interfaces (BMI) that has emerged from the need of creating BMI systems that feel natural and intuitive to the user. The first demonstration of such systems started over 40 years ago with a series of studies in which monkeys volitionally modulated single neuron activity through biofeedback. These systems exploit the volitional drive on cortical neurons that allows them to modify their tuning properties through a process of reward-modulated spike-timing-dependent plasticity. Recent studies have employed this alternative strategy to control motor neuroprosthesis and computer cursors, proving that single neuron activity is a promising signal for BMI control because of its greater simplicity to implement and to use.

The objective of this study was to evaluate a novel paradigm to elicit volitional modulation of neural activity in a rat model to control a two-degree of freedom BMI. In order to do this, we implanted microelectrodes in the motor cortex and trained the rat to modulate the activity from one selected neuron and maintain the firing target rate for up to 3 seconds. When the rat reached a low-rate target a food pellet was dispensed, while sucrose solution was dispensed with a high-rate target. The rat was free to choose whichever reward it wanted to obtain during the conditioning sessions. Biofeedback was provided in real-time through a LED that varied in brightness. We increased the difficulty of the task by incrementing/decrementing the firing rate thresholds or by increasing the hold time every 5-10 minutes.

In a previous study, we showed that the intrinsic spiking properties of cortical neurons determine the performance in a BMI task. We found that fast-spiking neurons are able to quickly adapt to arbitrary rules, while regular-spiking neurons cannot adapt in short periods of time.

In this study, the rat successfully learnt to control two degrees of freedom with fast-spiking neurons. In total, 7 neurons were used to control the BMI. Some interesting observations include: (1) the rat initially preferred to obtain food pellets (low-rate targets) in the first

half of the session and abruptly switched to sucrose solution (highrate targets) in the second half of the session; (2) the rat successfully suppressed the activity of the neuron and at the same time, was then able to generate bursts of high activity with the same neuron and maintain it for as long as 3 seconds; (3) in the last 3 days of training, the rat no longer showed such marked reward preference during the sessions, but instead learnt to balance the amount of food/sucrose solution rewards obtained in each experiment.

Further work is needed to probe the capabilities and limitations of using operant conditioning of neural activity to develop robust and reliable BMI systems, but we firmly believe this paradigm holds great promise to restore movement after paralysis.

SP041.5 - Electroencephalography-Based Off-Line Prediction of Specific Grasping Actions Performed with the Same Hand: Towards Integration of Brain-Computer Interfaces and Functional Electrical Stimulation Therapy

Author(s): <u>Cesar Marquez-Chin</u>¹, Kathryn Atwell¹, Milos Popovic² ¹Research Department, Toronto Rehabilitation Institute University Health Network, Toronto/CANADA, ²Institute Of Biomaterials And Biomedical Engineering, University of Toronto, Toronto/CANADA

Objectives

There is growing interest in the use of brain-computer interfaces (BCI) for rehabilitation of neurological conditions such as stroke. We have developed functional electrical stimulation (FES) therapies and technologies for almost two decades achieving remarkable restoration of upper limb function. In FES therapy, patients attempt specific functional tasks (e.g., lifting a mug from a table) and, simultaneously, the movement is facilitated with electrical pulses applied to the arm/hand. We are now combining our FES systems with a BCI to assess the efficacy of FES therapy when matching the intended and facilitated movements. The objective of this work was to explore the possibility of identifying specific hand grasps, performed with the same limb, using EEG analysis.

Materials and Methods

Fifteen participants (mean age was 32 and six were women) with no known neurological conditions performed six hand movements in a ready-go-stop sequence while we recorded EEG signals (C1, C2, C3, C4, Cz, F3, F4, and Fz). Four of the movements are commonly trained during stroke rehabilitation (two-finger pinch, palmar and lumbrical grasps, and hand opening — all finger extension). The movements were repeated at least 30 times with the participants' self-identified dominant hand, and four of the subjects repeated the experiment with their non-dominant hand.

The time-resolved spectra (256-sample Hamming window, 128 sample overlap, 256-FFT) between 1 Hz and 50 Hz for all EEG recordings were smoothed and correlated with a hyperbolic tangent function to identify decreases in power (typically associated with the preparation and execution of voluntary movement). The spectral components and time ranges with the largest correlation values resulted in movement-specific maps that were used as features to implement a nearest-neighbour classifier.

Results

For all participants, at least three dominant hand movements were identified correctly with accuracies between 64%-75%, and 67%-85% when the non-dominant hand was used. We found a difference in accuracy for only one of the movements when the analysis was limited to only ipsilateral or contralateral electrodes. Classification of the different intended movements took place 1.2s (+/- 0.8s) to 0.7s (+/- 0.9s) before dominant hand movement onset and 0.7 s (+/- 0.9 s) to 0.4 s (+/- 0.4s) for non-dominant hand movements.

Conclusions

Our results are comparable to other reports describing the prediction and identification of movements performed with the same limb (92% [1] and 45% [2] with 163 and 128 EEG electrodes, respectively). However, the work presented here uses a maximum of eight EEG electrodes increasing its viability for use in a clinical environment. Our next steps will consist of testing the presented procedure with stroke and spinal cord injury patients. To the best of our knowledge, this is the first report on the analysis of EEG activity to predict specific hand movements targeted in stroke and spinal cord injury rehabilitation performed with the same limb, .

SP041.6 - Wireless Distributed Intracortical Neural Interfacing: A New Approach for Brain Machine Interfaces

Author(s): <u>Alireza Zabihian</u>¹, Amir Massoud Sodagar², Mohamad Sawan¹

¹Electrical Engineering, Polytechnique Montreal, Montreal/CANA-DA, ²Electrical And Computer Engineering, K.N.Toosi University of Technology, Tehran/IRAN

Brain Machine Interfaces (BMIs), as promising devices for assisting patients with motor disabilities and/or neurological injuries, demand for high-performance recording/simulating capabilities in terms of speed, quality, and quantity, i.e. higher bandwidth, signal-to-noise ratio for neural signal, and interfacing area on cerebral cortex. In this abstract, we present the architecture of a wireless network of implantable microsystems.

There are three major approaches to electrically interface with the brain. They differ in spatial resolution, quality level of signal, and practical area to interface with. Electroencephalography (EEG) is a major approach to record brain activities using multiple surface electrodes on the scalp with poor spatial resolution. Electrocorticography (ECoG) utilizes surface electrodes mounting directly on exposed surface of cerebral cortex. Single-Unit Neural Interfacing is a method to measure single neurons electro-chemical activities (action potentials) using a microelectrode array system. In the last decade, Intracortical Neural Interfacing using wireless implantable microsystems with microelectrode arrays has realized wireless neural prostheses with higher spatial resolution, higher signal quality, and feasibility of freely movement of patient under study. But, in fact, the effective area covered with microelectrode arrays is too limited for most relevant applications.

Here, we propose a novel neural interfacing approach which is as high-performance as intracortical neural interfacing in terms of spatial resolution, quality of signal, and feasibility of freely movement; as well, similar to EEG and ECoG, it covers a significant area of cerebral cortex. The idea is to network several wireless implantable microsystems, which we call it Brain-ASNET: "Brain Area Sensor NETwork" (Fig. 1). To realize the proposed idea, there are many design aspects to be considered, including network architecture and protocol, and sensor node form factor and power consumption. We choose a star network topology, an ad-hoc TDMA MAC protocol, and OOK modulation in 902-928MHz ISM frequency band. The Custom Integrated Circuit (CIC) is designed and laid-out in an IBM 0.13µm CMOS process. The post-layout simulation results show energy efficiency of the designed ad-hoc network protocol and low power dissipation of the CIC. The whole chip, including all functional and peripheral integrated components, consumes 138µW and 412µW, at 1.2V, configured in a synchronized network as a sensor node and the coordinator, respectively.

At the congress, we will present design and implantation aspects of the proposed network, including proposed network architecture and protocol design, the CIC design, and a conclusion will be presented.

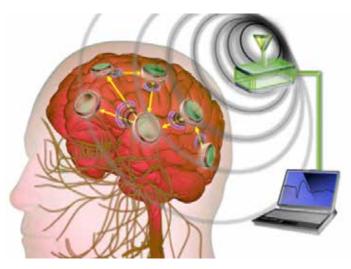

Fig. 1. Illustration of the proposed Brain-ASNET approach

SP041.7 - Design and construction of a brain-computer interface for applications in neuro-robotics

Author(s): <u>Alma R. Méndez Gordillo</u>, Marco A. Espinosa Medina, Miguel Villagómez Galindo

Mechanical Engineering, Universidad Michoacana de San Nicolás de Hidalgo, Morelia/MEXICO

A brain computer interface (BCI) is a device that helps people with motor impairments, to communicate externally using the electrical activity of the brain without the assistance of peripheral nerves or muscle activity, promising further improved quality of life of patients. This investigation presents the design and construction of a neural interface in order to study the signals produced by the brain, using a Mindwave mobile prototype device, which measure spectra power of EEG (Electroencephalography, i.e. alpha waves, beta waves, etc.), NeuroSky eSense meters (attention and meditation) and eye blinks in a safety way. As the main objective is to control 3 axis biomedical devices, particularly a robotic arm Model: K-680 Steren, it is important to highlight the contribution of this work in the control, which will be held through Matlab and ArduinolO programs.

SP042 - Technology Management Programmes and Equipment Management Systems

TRACK 16: CLINICAL ENGINEERING, CLINICAL PHYSICS, AND PATIENT SAFETY

SP042.1 - Medical device systems Health Technology Management (HTM) strategies and best practices Author(s): <u>Tom Judd</u>

Kaiser Permanente Clinical Technology, Atlanta/GA/UNITED STATES OF AMERICA

Medical device systems Health Technology Management (HTM) strategies and best practices are now well established in most first world and many developing countries¹. Plans are underway to address identified gaps in HTM, e.g., appropriate equipment selection and lifecycle management. One approach is the 25 years of HTM Seminars provided by WHO-PAHO, IFMBE CED, and ACCE to 70 countries².

There is a new emerging challenge in this space as well, that is the requirement for medical device integration into electronic health records to improve quality and safety of care³.

The Keynote will review this HTM progress, gaps, and new challenges. It will provide a framework to move us forward in collaborative fashion.

SP042.3 - Development of a scoring system to support medical equipment replacement prioritization using the Analytical Hierarchy Process (AHP)

Author(s): Paul Prowse, Kyle Eckhardt, Sarah Kelso

Clinical Engineering, Winnipeg Regional Health Authority, Winnipeg/CANADA

The Winnipeg Regional Health Authority's (WRHA) current approach to medical equipment prioritization is based largely on anecdotal evidence and qualitative information provided by the staff who use the equipment. A group of stakeholders representing clinical programs determines how the equipment is ranked for replacement through a peer-to-peer democratic process. However, the voters have little understanding of the true urgency of equipment replacement for the other clinical programs, so votes are won based on the ability of the program to present a compelling argument. The WRHA's Clinical Engineering Program sought to develop a universal scoring system based on objective criteria to assist in this prioritization process.

A literature review revealed several scoring systems that have been developed utilizing a wide variety of criteria. From these criteria, four were selected for consideration: age, repair cost, reliability, and risk level. These were selected because they are frequently reported as predictors of replacement priority, and also because they could be universally applied to all equipment based on information available in our in-house Computerized Maintenance Management System (CMMS).

Previous studies have applied relative importance weightings to their chosen criteria based on expert opinion. Few have used a systematic approach, however, to determining the respective weightings. In the newly developed system, the pairwise comparison approach of the Analytical Hierarchy Process (AHP) is employed to determine weights that accurately represent each factor's contribution to a device's replacement urgency. The AHP was completed by several multidisciplinary groups including clinical engineers, nurses, managers, and administrators. The results from each group and the literature review were averaged to establish the final criteria weightings.

With the weightings established, a score from 0 to 100 was applied to each electro-medical asset with a purchase value greater than \$10 000 and recorded in our CMMS. A report of this equipment was distributed to each clinical program to highlight the replacement priority of their equipment as defined by this system. Provided with objective information, decision makers can be better informed about equipment that needs replacement.

Limitations of this system relative to our regional CMMS will be explored alongside the advantages of this process over those developed previously. A summary of the effectiveness of our work in the first year and an outline of our second phase goals will be presented.

SP042.4 - Multi-criteria decision analysis to redesign an Italian Clinical Engineering Service under specific needs and regulation requirements

Author(s): <u>Irene Lasorsa</u>¹, Giulia Abis¹, Barbara Podda², Agostino P. Accardo¹

¹Department Of Engineering And Architecture, University of Trieste, Trieste/ITALY, ²Clinical Engineering Service, ASL 5, Oristano/ITALY

The aim of this study is to fulfill the need of re-engineering the Clinical Engineering Service in an Italian ASL (Local Health Authority) located in Sardinia, in accordance with the Italian regulations for healthcare.

Even if methods for processes redesigning in healthcare organizations are available in the literature, there are no recent evidences of their application in Clinical Engineering Services.

Among the multi-criteria techniques, in this work PAPRIKA was used, since it is an easy-to-use and intuitive method for multi-criteria decision making, based on decision-makers' preferences.

We identified the decision makers' criteria (Table 1) to be fulfilled and four different preference levels for each criterion (Table 2), as inputs of the method. Moreover four different scenarios were identified and, for each scenario and criterion, the decision makers selected the most suitable level. In order to reduce the number of pairwise comparisons among the preference levels associated to the identified criteria, the online software 1000minds, implementing the PAPRIKA method, was used.

After 460 steps, the software allowed to rank the four possible scenarios. The results show that the Alternative A2 (Outsourced management of some of the activities), weighting 68.8%, represents the best solution for the ASL, followed by the Alternative A1 (current situation), weighting 60.8%, and the Alternatives A3 (Compliant to the Italian Ministerial Program SIGAE 4, CONSIP) and A4 (FULL

RISK contract), both weighting 28.2%.

The application of the PAPRIKA method for redesigning the Clinical Engineering Service in compliance with national and regional requirements for hospital accreditation can be considered successful.

Table 1 - Criteria of interest

Criteria	Description	
C1	Dimensioning of human resources at CES	
C2	Effects on the organization: work processes	
C3	Supervisory capacity of the administration	
C4	Quality of provided services	
C5	Emergency and urgent problems resolution	
C6	Annual costs the for biomedical technologies management	

Table 2 - Levels of preferences for each Criterion

Criteria	Level	Description
C1	L1	2 engineers, >3 technicians
	L2	1 engineer, 3 technicians
	L3	1 engineer, 2 technicians
	L4	1 engineer, 1 technician
C2	L1	A unique company in charge of all the activities
	L2	A unique company in charge of MP and VSE
	L3	Different companies in charge of the activities
	L4	CES in charge of all the activities
C3, C4	L1	Excellent
	L2	Good
	L3	Sufficient
	L4	Insufficient
C5	L1	Always guaranteed
	L2	Always guaranteed during work- ing hours
	L3	Occasionally guaranteed during working hours
	L4	Never guaranteed
C6	L1	≤2million€
	L2	>2million€, ≤2,25million€
	L3	>2,25million€, ≤2,5million€
	L4	>2,5million€

SP042.5 - Developing a system to support equipment repair versus replacement decision making

Author(s): <u>Sarah Kelso</u>, Petr Kresta Clinical Engineering Program, Winnipeg Regional Health Authority, Winnipeg/CANADA

Within the Winnipeg Regional Health Authority there is currently no system in place to guide the process of deciding whether a device suffering a major failure should be repaired or replaced. While the question may not arise frequently, it was determined that a consistent, methodical approach would significantly improve the confidence of decision makers and equipment owners, when Clinical Engineering recommends proceeding with a costly repair, or equipment replacement.

The development of a repair versus replace decision making process encompassed three major pieces of work: define a maintenance approach, establish a process for decision making including factors for consideration, and identify the repair cost threshold at which device replacement should be seriously considered.

Thorough analysis of the repair history data for four sample fleets of equipment indicated a general trend of modest increases in repair costs with age over the study period, but no statistically significant relationship between age and repair cost or repair frequency was identified. Therefore, maintenance/replacement approaches based on the assumption that the equivalent annual costs of maintenance will surpass the projected equivalent annual cost of replacement cannot be directly applied.

A two-phase process for repair versus replacement decision making was developed. The first phase relies on a single repair cost limit, set at 50% of the device acquisition cost, to flag the most costly repairs for further review.

The second phase incorporates factors used for equipment replacement planning, determined through an extensive literature review, to evaluate whether a specific case supports repair or replacement. Ten (10) criteria were selected for this evaluation:

- Past repair cost,
- Age,
- Past reliability,
- Present labour effort,
- Manufacturer support,
- Estimated useful life remaining,
- Projected reliability,
- Condition,
- Past usage, and
- Future usage.

The repair cost threshold value of 50% of acquisition cost has been selected as a starting point. This is near the mid-point of the range suggested in the literature. In our case the limit will be applied to parts and external labour costs only (i.e. not in-house labour costs), and is therefore additionally conservative.

A Clinical Engineering standard operating procedure, evaluation worksheet, and communication template were created to support the process. Next steps will include defining applicability to equipment groups/types and limitations therein, clinical stakeholder (equipment owner) education and consultation, implementation across Winnipeg region, and monitoring and improvement.

SP042.6 - An assessment of Preventive and Performance Maintenance Of Theater Equipment In Public Hospitals Kenya: Case study Five Public Hospitals.

Author(s): Philip A. Anyango

Medical Engineering, Kakamega County GeneralHospital, Kisumu/ KENYA

Medical devices play a key role in health care delivery. They are vital for diagnosis, therapy, monitoring, rehabilitation and care. Effective management of these devices is required to satisfy high quality patient care, clinical and financial governance, including minimising risks of adverse events. Unless medical devices are managed proactively, the same types of adverse incidents happen repeatedly. Good medical device management will greatly assist in reducing their potential for harm.

Cases where life has been lost because of faulty equipment and where patients has been turned away due to non functioning equipment has been captured in both print and electronic media on Kenya. One of the results of the studies done on medical equipment countries cites non functional equipment, as one of the challenges. Lack of maintenance and inadequate funding were found to be the main cause. In the past two decades most countries in Sub Saharan Africa in collaboration with development partners have tried to put in measures to address the challenges including training of technicians, building and equipping workshops. However the challenge still remains. Operation room (theatre) is one of the hospital departments that handle emergency cases and therefore equipment used inside must be in an optimum state all the time.

This paper is about an assessment on preventative and performance assurance maintenance of theatre equipment in five public county referral hospitals in Kenya namely Kisumu, Vihiga, Homa Bay and Kakamega. These hospitals were sampled because of Geographical location and high volume of patients handled.

The assessment focused on four major equipment used in operation room namely, anaesthetic machine, vital signs monitor, suction machine and electrosurgical unit. The main objective was to assess why equipment fail. Areas assessed included; Mode of service and maintenance, compliance to manufacturer's guidelines,, Stick on a dated 'SERVICED' label noting the next date due,, records of the activities carried, by whom, date and signature, availability of service manual, Training and certification of service engineers and possible challenges.

The findings were analyzed and Preliminary results were as follow

On Compliance with manufacturer's guidelines it was found out that; Most maintenance is done by in house staff, Very few equipment are under service contract, Manufactures service and timeline instructions are not followed to the letter. Training and certification of engineers- No evidence of certification of service engineers, Records were not well kept, Major challenges identified included; Insufficient funding'. Inadequate staff and adequate skills
